April 2011

1. Introduction

This brief methodology has been produced as a guide for external consultants regarding the Historic Landscape Characterisation (HLC) data held by Staffordshire County Council.

Since the original methodology was produced in February 2008 a number of new Revised HLC types have been added to the Broad Type 'Fieldscapes'. This was done to take into account the greater potential for historic components to survive within certain landscapes of later origin.

2. Methodology

2.1 Historic Landscape Character (HLC)

This is a brief summary of the methodology of the Staffordshire HLC project; please refer to the final report for further information.

The Staffordshire HLC was completed between April 2003 and March 2006 and was carried out in partnership with English Heritage as part of a national programme.

The primary object of the Staffordshire HLC was to characterise, or describe, the county's historic landscape utilising the County Council's Geographic Information System (GIS) to produce a character map for the entire county. The project used digital sources such as the First Edition 6" OS maps (1880s), the OS 1:10,000 maps (circa 2003), Yates' map (1775) and aerial photography (2000).

All of the HLC projects carried out across the country are value-free. Ascribing value to the HLC is considered to form a second stage to the initial project.

The HLC is being updated on an ad hoc basis where it is obvious that the landscape has changed since the project was originally carried out.

See Appendix A for the definition of the current HLC types used within the Staffordshire project.

2.2 Refined HLC

The Refined HLC has been created by combining the original HLC types by those with a similar character and period of origin. The tables in Section 3 exemplify this process; the first two columns ('HLC Type' and 'Period of Origin' determine the third column 'Refined HLC'. This process intends to embed a degree of meaning into the Refined HLC types thus making the data more easily readable in GIS.

There were 65 HLC types identified within the original dataset and the combining process resulted in 35 Refined HLC types.

At a broad level the Refined HLC allows at a glance the overall changes which have occurred particularly in the mid to late 20th century. For example the HLC type 'Very Large Post War Fields' in the original HLC have been re-categorised as 'Post War

Amalgamated Fields' in the Refined HLC (along with other relevant HLC types). The Refined HLC type, therefore, pre-supposes that all the landscapes designated as 'Post War Amalgamated Fields' are field systems whose earlier historic character has been degraded through the removal of field boundaries, although individual historic boundaries may survive. These landscapes, however, are likely to have a lower heritage value than those where the integrity of the field system survives. Any assessment of the heritage value, however, should also take into account data held by the Historic Environment Record (HER) relating to individual sites.

3. Refined HLC Types definitions

3.1 Broad Type: Communications

3.1.1 Refined HLC Type: Communications

HLC Type	Period of Origin	Refined HLC Type
Airfield	Modern	Communications
Major Road Junction	Modern	Communications
Service Station	Modern	Communications
Canal Locks/Basin	Industrial and Modern	Communications
Train Station/Sidings	Industrial and Modern	Communications

An analysis of the Broad Type in the original dataset found that all Communications recorded had their origins in either the Industrial or Modern period. The earliest features recorded are the specific features along the canal and railway infrastructure. Many of the surviving canals have been designated as Conservation Areas and some surviving features are protected as Listed Buildings.

However, the majority of the HLC types under Communications were found to relate to the modern road system in particular road roundabouts.

3.2 Broad Type: Field Systems

HLC Type	Period of Origin	Refined HLC Type
Drained Wetlands	All Periods	Drained Wetlands
Irregular Squatter Enclosure	Mainly Industrial	Squatter Enclosure
Large Assarts with Sinuous Boundaries	Medieval and Post Medieval	Early Assarts
Large Assarts with Sinuous Boundaries	Industrial, Post-1914 and Post-War	Recent Woodland Clearance
Large Irregular Fields	Medieval and Post Medieval	Early Irregular Enclosure
Large Irregular Fields	Industrial and Post-1914	Post 1880s Reorganised Fields
Large Irregular Fields	Post-War	Post War Amalgamated Fields
Other Large Rectilinear Fields	Post Medieval and Industrial	18th/19th Century Semi Planned Enclosure
Other Large Rectilinear Fields	Post-1914	Post 1880s Reorganised Fields

Other Large Rectilinear Fields	Post-War	Post War Amalgamated Fields
Other Small Rectilinear Fields	Medieval and Post Medieval	Early Small Rectilinear Fields
Other Small Rectilinear Fields	Industrial, Post-1914 and Post-War	Post 1880s Small Replanned Enclosure
Paddocks/Closes	All are Post Medieval or Industrial	Pre 1880s Paddocks & Closes
Piecemeal Enclosure	Post Medieval and Industrial	Piecemeal Enclosure
Planned Clearance/Assartment	Medieval and Post Medieval	Early Assarts
Planned Clearance/Assartment	Industrial, Post-1914 and Post-War	Recent Woodland Clearance
Planned Enclosure	Post Medieval and Industrial	18th/19th Century Planned Enclosure
Planned Enclosure	Post-1914	Post 1880s Reorganised Fields
Planned Enclosure	Post War	Post War Amalgamated Fields?
Rectilinear Squatter Enclosure	Medieval, Post Medieval and Industrial	Squatter Enclosure
Reorganised Piecemeal Enclosure	Post Medieval	Early Reorganised Piecemeal Enclosure
Reorganised Piecemeal Enclosure	Industrial?. Post-1914 and Post War	Post 1880s Reorganised Piecemeal Enclosure
Small Assarts	Medieval and Post Medieval	Early Assarts
Small Assarts	Industrial, Post-1914 and Post-War	Recent Woodland Clearance
Small Irregular Fields	Medieval, Post Medieval and Industrial	Early Irregular Enclosure
Small Irregular Fields	Post-1914 and Post War	Post 1880s Small Replanned Enclosure
Very Large Post War Fields	Post-War	Post War Amalgamated Fields

3.2.1 Refined HLC Type: 18th/19th Century Planned Enclosure

These fields were created, or have the appearance of having been created, by surveyors during the 18th and 19th centuries to create a landscape of fields with very straight boundaries, giving them a geometric, planned appearance. Some of these fields were enclosed as a result of Acts of Parliament. In Staffordshire the majority of these fields were created out of former commons, heathland or moorland, but in some areas they may formerly have been arable open fields dating from the medieval period.

These field systems are fairly common across Staffordshire, but much of the county had already been enclosed prior to this date and they therefore relate to a relatively small area.

The origins of these planned field systems are generally well understood and they often have landscape relations with other important historic landscape elements such as model farms and designed parklands (Refined HLC type 'Historic Parks and Gardens').

3.2.2 Refined HLC Type: 18th/19th Century Semi Planned Enclosure

Fields described within the HLC as 'rectilinear' dating to the Industrial, and in some specific cases Post Medieval, period still have a planned appearance. The overall form, however, does not suggest that the whole area was planned by a surveyor as is the case for the planned enclosure described above.

3.2.3 Refined HLC Type: Drained Wetlands

This HLC type has not been classified by period of origin. However, the draining of the Staffordshire wetlands has occurred since at least the late 18th century, but grew apace with technological advances from the mid 19th century onwards. It is not a common Refined HLC type across the country because of the difficulty of identifying them within the original HLC project.

There may be some relation between this type and the Watermeadows project carried out in 2008/2009.

3.2.4 Refined HLC Type: Early Assarts

Assarting is recorded in historical documents for Staffordshire from the 11th century onwards. They are identified as areas of land which have been enclosed out of ancient woodland. Very few assarts have been positively identified within the HLC and other currently unrecognised assarting may be incorporated under the Refined HLC types 'Early Irregular Enclosure' or possibly 'Early Small Rectilinear Fields'.

3.2.5 Refined HLC Type: Early Irregular Enclosure

These fields are assumed to mostly date from the Post Medieval period. Their history is not always well understood except where this can be seen within the context of a particular landscape. For instance in upland areas of the county it is likely that this Refined HLC type represents the earlier stages of the enclosure of moorland which probably occurred from the later medieval period onwards. In other areas they may represent unrecognised 'Piecemeal Enclosure' (see below), early encroachment onto 'Unenclosed Land' (see below) or as unrecognised 'Early Assarts' (see above).

The 'Industrial' period has been included within this type because of the predominant morphology of the field pattern rather than a strict adherence to period of origin. This is because the period of origin may not be well understood given the restrictions of the sources used within the original HLC project.

3.2.6 Refined HLC Type: Early Reorganised Piecemeal Enclosure

This Refined HLC Type has only recently been recognised and its period of origin dates specifically to the 18th and 19th centuries. It is related to 'Planned Enclosure' in that it appears to be associated with the replanning of earlier field systems, specifically 'Piecemeal Enclosure' (see below). It is typified by a mix of typical 'Piecemeal Enclosure' type field boundaries (see below) and straight boundaries more commonly seen within '18th/19th Century Planned Enclosure' (see above).

3.2.7 Refined HLC Type: Early Small Rectilinear Fields

This HLC type relates to those fields which have been recognised within the dataset as having (or likely to have) Post Medieval origins. In some areas more detailed research may shown they have earlier or later origins. In the upland areas they are frequently associated with stone walls which are particularly characteristic of those landscapes.

In the uplands they may be associated with the enclosure of moorland (Refined HLC 'Unenclosed Land' see below).

3.2.8 Refined HLC Type: Piecemeal Enclosure

This type refers solely to those areas which had previously been open arable fields from the medieval period onwards. These are identified through map evidence by the reverse 'S', curvilinear and sometimes dog-leg field boundaries; these indicate that the enclosure has followed the earthworks of the former medieval strip fields (or open fields). Piecemeal enclosure is a process which documentary sources suggest had begun in Staffordshire by the early 16th century, with the last fields appearing to have been enclosed during the 18th century. The enclosure was carried out incrementally by means of informal, verbal agreements between farmers who wished to consolidate their holdings (the individual strips spread across the open field system).

3.2.9 Refined HLC Type: Post 1880s Reorganised Fields

This Refined HLC Type reflects changes to the field patterns in the period since the publication of the First Edition 6" OS map which have not resulted in either the enlargement or subdivision of fields (for which see Post War Amalgamated Fields and Post 1880s Small Replanned Enclosure respectively).

3.2.10 Refined HLC Type: Post 1880s Reorganised Piecemeal Enclosure

This Refined HLC type represents those fields that were identified by this HLC type in the original project. It represents changes to the field pattern which have occurred in the period since the publication of the First Edition 6" OS map (e.g. Post-1914 and Post-War date). Its previous types will always be 'Piecemeal Enclosure' and 'Strip Fields' which reflect the former medieval open fields. Despite 20th century changes these fields potentially retain some legibility of the earlier pattern and distinctive field boundaries.

3.2.11 Refined HLC Type: Post 1880s Small Replanned Enclosure

These are fields which have been recognised as having been created over the last century or so. They may represent the reorganisation of earlier field systems or the establishment of fields in areas which had been Industrial and Extractive during the 19th century for example. They also apply to the subdivision of larger fields for horse paddocks, usually enclosed with fencing.

3.2.12 Refined HLC Type: Post War Amalgamated Fields

The period of origin for this Refined HLC Type is always 'Post-1945' and reflects the intensification of agriculture from the end of the Second World War, which resulted in the loss of many field boundaries.

3.2.13 Refined HLC Type: Pre 1880s Paddocks & Closes

These are small fields recognised in the original HLC dataset that are located on the edge of settlements and which have been given a period of origin in the Medieval and Post Medieval periods. In many cases these probably represent small meadows and paddocks.

3.2.14 Refined HLC Type: Recent Woodland Clearance

This type represents the advance of farmland at the expense of woodland in the period between the 19th and early 21st centuries.

3.2.15 Refined HLC Type: Squatter Enclosure

Mainly of Industrial date within the Staffordshire dataset and frequently associated with areas of early industry. They can generally be seen to represent encroachment onto Unenclosed Land and are often associated with small farmsteads or small holdings (see Farmsteads data). It is a rare landscape type and its integrity is sensitive to change through boundary loss and reorganisation.

3.3 Broad Type: Industrial and Extractive

3.3.1 Refined HLC Type: Industrial and Extractive

HLC Type	Period of Origin	Refined HLC Type
Colliery	Industrial and Modern	Industrial and Extractive
Derelict Industrial Land	Industrial and Modern	Industrial and Extractive
Disused Colliery/Spoil Tips	Industrial and Modern	Industrial and Extractive
Industrial Complex	Industrial and Modern	Industrial and Extractive
Quarry	Industrial and Modern	Industrial and Extractive
Quarry Inactive	Industrial and Modern	Industrial and Extractive
Stone Quarry	Industrial and Modern	Industrial and Extractive

The majority of the land identified within the original HLC data has been found to have originated in the Modern period (1914 to present) although a few have been identified as originating in the Industrial period (1800-1913). Consequently only one 'Refined HLC type' was assigned for these sites.

The lack of earlier industrial and extractive sites within the HLC may partly be explained by the fact that in general industry prior to the mid 19th century was carried out on a smaller, even domestic scale and was therefore did not cover a sufficient area (of at least 1ha) to be represented in the HLC. However, such sites are considered an important part of the historic environment and are recorded on the Staffordshire Historic Environment Record (HER) where they are known.

3.4 Broad Type: Military

3.4.1 Refined HLC Type: Military

HLC Type	Period of Origin	Refined HLC Type
Abandoned Barracks	Modern	Military
Airfield	Modern	Military
Barracks	Modern	Military
Former Ordnance Depot Now Used For Other Purposes	Modern	Military
Other Military	Modern	Military

These landscapes relate to Airfields, and any surviving features, but also to any current and former military buildings such as barracks and depots. Some of the surviving buildings or elements of military sites associated with the two World Wars are of at least local if not national importance.

3.5 Broad Type: Ornamental, Parkland and Recreational

HLC Type	Period of Origin	Refined HLC Type
Golf Course	Any Period	Other Parkland
Other Parkland	Any Period	Other Parkland
Parks and Gardens	Post Medieval and Industrial	Historic Parks and Gardens
Sports Fields	Any Period	Other Parkland

3.5.1 Refined HLC Type: Historic Parks and Gardens

This type relates to all the parks and gardens in the county mostly created from the 18th century onwards. It includes, but is not limited to, those which are included in the English Heritage Register of Parks and Gardens.

3.5.2 Refined HLC Type: Other Parkland

This category includes golf courses and sports grounds which are predominantly of 20th century date (Post-1914 and Post War).

3.6 Broad Type: Settlement

HLC Type	Period of Origin	Refined HLC Type
Historic Settlement Core	Medieval and Post Medieval	Pre 1880s Settlement
Post 1880s Settlement	Post-1914, Post War	Post 1880s Settlement
Pre 1880s Settlement	Medieval, Post Medieval and Industrial	Pre 1880s Settlement

Redeveloped Pre 1880s Settlement	Industrial, Post-1914 and Post War	Post 1880s Settlement

3.6.1 Refined HLC Type: Post 1880s Settlement

This category includes settlement which has been largely redeveloped since the late 19th century as well as developments on 'green field' sites over the last century or so. In the latter case especially the overall character of this category will incorporate associated road systems.

3.6.2 Refined HLC Type: Pre 1880s Settlement

This type relates to the earliest areas of settlement and is more likely to retain historic buildings (including Listed Buildings) as well as a historic street pattern.

3.7 Broad Type: Unenclosed Land

HLC Type	Period of Origin	Refined HLC Type
Heathland	Medieval	Early Unenclosed Land
Heathland	Post-1914 and Post War	Recent Regenerated Unenclosed Land
Moorland	Medieval and Post Medieval	Early Unenclosed Land
Moorland	Post-1914 and Post War	Recent Regenerated Unenclosed Land
Other Commons	Medieval and Post Medieval	Early Unenclosed Land
Other Commons	Industrial, Post-1914 and Post War	Recent Regenerated Unenclosed Land
Other Unenclosed Ground	Post-1914 and Post War	Recent Regenerated Unenclosed Land
Unimproved Enclosed Hill Pasture	Medieval and Post Medieval	Enclosed Hill Pasture
Unimproved Open Hill Pasture	Medieval	Early Unenclosed Land

3.7.1 Refined HLC Type: Early Unenclosed Land

This category includes the original HLC types Moorland, Heathland, Other Commons and Unimproved Open Hill Pasture. These are landscapes which are little changed from their depiction on the First Edition 6" OS map; many may represent fragments of larger areas of Unenclosed Land depicted upon Yates' map of Staffordshire (1775). Consequently these landscapes represent some of the earliest in the county and are less likely to have been subjected to intensive farming practices over the last century so there is a greater potential for the survival of upstanding archaeological sites to survive. Along with these considerations is the acknowledgment that they are fragile and increasingly rare landscapes.

3.7.2 Refined HLC Type: Enclosed Hill Pasture

All of the 'Enclosed Hill Pasture' identified in Staffordshire have been assumed to have medieval origins. It is very rare within the county as a whole, being confined to the Staffordshire Moorlands.

3.7.3 Refined HLC Type: Recent Regenerated Unenclosed Land

These unenclosed landscapes comprise the original HLC types Moorland, Heathland, Other Commons and Other Unenclosed Ground where it has been identified that they had a different land use prior to the current HLC type. For instance they may have been farmland, or more frequently, the site of an industrial or extractive works at the time of the First Edition 6" OS map. In the intervening period the land has either been allowed to revert naturally or has been deliberately re-established as part of a Nature Reserve or other scheme to enhance bio-diversity.

3.8 Broad Type: Water and Valley Floor Fields

HLC Type	Period of Origin	Refined HLC Type
Artificial Lake/Pond	Any Period	Artificial Water Bodies
Floodplain Marshes	None recognised in the modern landscape	N/A
Miscellaneous Floodplain Fields	Any Period	Miscellaneous Floodplain Fields
Moss/Raised Bog	None recognised in the modern landscape	N/A
Natural Open Water	Any Period	Natural Open Water
Reservoir	Any Period	Artificial Water Bodies

3.8.1 Refined HLC Type: Artificial Water Bodies

These bodies of water have not been identified by period of origin within the Refined HLC, but may include mill ponds, ornamental lakes in parkland. Many of these sites will also be recorded within the HER.

3.8.2 Refined HLC Type: Miscellaneous Floodplain Fields

These are the fields which line the sides of river valleys and whose origins may be of a variety of dates, although the majority have been classified as being of Post Medieval date. Some of these landscapes will have been extensively drained from the 17th century onwards, or have been utilised as water meadows from a similar period (see the Water Meadows Survey data for further information on the latter).

3.8.3 Refined HLC Type: Natural Open Water

There are very few sites identified within Staffordshire within the modern landscape, although this may be in part due to drainage from the 17th century onwards. These sites are consequently particularly rare within Staffordshire and often form the basis of designated sites of biodiversity interest.

3.9 Broad Type: Woodland

HLC Type	Period of Origin	Refined HLC Type
Broadleaved Ancient Woodlands	Any Period	Ancient Woodland
Mixed Ancient Woodlands	Any Period	Ancient Woodland
Broadleaved Woods With Sinuous Boundaries	Medieval, Post Medieval and Industrial	Other Early Woodland
Coniferous Woodland With Sinuous Boundaries	Medieval, Post Medieval and Industrial	Other Early Woodland
Mixed Woods With Sinuous Boundaries	Medieval, Post Medieval and Industrial	Other Early Woodland
Other Woods With Sinuous Boundaries	Medieval, Post Medieval and Industrial	Other Early Woodland
Broadleaved Woods With Sinuous Boundaries	Post-1914 and Post War	Other Recent Woodland
Mixed Woods With Sinuous Boundaries	Post-1914 and Post War	Other Recent Woodland
Coniferous Woodland With Sinuous Boundaries	Post-1914 and Post War	Other Recent Woodland
Other Woods With Sinuous Boundaries	Post-1914 and Post War	Other Recent Woodland
Broadleaved Plantation	Any Period	Plantations
Coniferous Plantation	Any Period	Plantations
Mixed Plantation	Any Period	Plantations
Other Plantation	Any Period	Plantations
Replanted Ancient Woodlands	Post-1914 and Post War	Recent or replanted ancient woodland

3.9.1 Refined HLC Type: Ancient Woodland

These woodlands have been identified from the Ancient Woodland dataset now administered by Natural England (formerly English Nature). It is likely that many of these woodlands had their origins in at least the medieval period and earthworks associated with earlier woodland management may survive within them.

3.9.2 Refined HLC Type: Other Early Woodland

These are areas of woodlands which have been identified on historic maps, such as the first edition OS maps (c.1880s) and, in particular, Yates' map of Staffordshire (1775), but have not been identified as ancient woodlands by Natural England. This may be because the woodlands have been replanted since the 18th/19th century,

however, these may be on the sites of ancient woodlands which date to at least the medieval period and may retain earthwork features associated with early woodland management.

3.9.3. Refined HLC Type: Recent or Replanted Ancient Woodland

These are woodlands that have been identified by Natural England as having recently been replanted. These areas may also retain earthworks associated with earlier woodland management.

3.9.4 Refined HLC Type: Other Recent Woodland

These are woodlands that have been established since the 1880s, and most particularly in the second half of the 20th century, upon areas that had not previously been woodland.

3.9.5 Refined HLC Type: Plantations

On the whole this category dates from the 20th century. However, there are a few plantations which have been included within this category that have been identified as being of 18th/19th century and are often associated with historic parks. Consequently they should be read as being part of that Historic parks and gardens landscape.

APPENDIX A – HLC TYPES (reproduced from draft final report)

Unimproved land.

Historic Landscape Character Type	**Description and interpretation**
Moorland	Unenclosed land above 244m that supports moorland vegetation (e.g. heather, bilberry etc). Will usually have had the same historic character since at least the late medieval period. May contain well preserved monuments and landscapes dating to the medieval, Roman and prehistoric periods as extant features.
Unimproved open hill pasture	Unenclosed, unimproved grassland above 244m. Often represent areas of former common land. May preserve monuments and landscapes dating to the medieval, Roman and prehistoric periods as extant features..
Unimproved enclosed hill pasture	Enclosed, unimproved grassland above 244m. The field boundaries within these areas were probably set out in the post-medieval or industrial periods (or during the post-War period in association with wire fences). This character type also includes areas of land enclosed during these periods that have since begun to revert back to scrub and moorland.
Heathlands	Generally situated below the 244m contour line, this category distinguishes areas of heathland. In most cases this land was probably held in common during the medieval and early post-medieval period.
Other unimproved ground	Unimproved land that does not fall into any of the above categories.
Other common	This category includes areas of common land that do not fall into any of the above categories. For instance, it covers areas of lower lying ground that were used for communal grazing but which, on the basis of place name evidence, do not appear to have been heathlands.

Fieldscapes.

Historic Landscape Character Type	**Description and interpretation**
Irregular squatter enclosure	Field systems principally comprising small irregular fields with sinuous or curvilinear boundaries. The overall field pattern has an unordered, 'organic', often amorphous, appearance. These areas are often associated with networks of lanes and access tracks and small cottages. In addition, they may be associated with mining, quarrying or other industrial activity. They are usually indicative of encroachment onto common land in the post-medieval or industrial periods.
Rectilinear squatter enclosure	Field systems principally comprising small rectilinear fields with straight boundaries. The overall field pattern has a more planned appearance than in areas of 'irregular squatter enclosure'. These areas are often associated with networks of lanes and access tracks and small cottages. In addition, they may be associated with mining, quarrying or other industrial activity. They are usually indicative of encroachment onto common land in the post-medieval or industrial periods.
Paddocks/closes	Small irregular fields distinguished from 'other small fields' character type by their location on the edge of settlements. In many cases these probably represent small meadows and paddocks.
Small assarts	Field patterns consisting of small rectilinear or irregular fields that appear to have been created through woodland clearance. They will either border, or occur in close proximity to, areas of ancient woodland.
Large assarts with sinuous boundaries	Field patterns comprised of large irregular or rectilinear fields with predominately sinuous boundaries that appear to have been created through woodland clearance. Includes fields created through recent (e.g. post-1880s) amalgamation of areas of small assarts. Either border or occur in close proximity to areas of ancient woodland.
Planned clearance/ assartment	Field patterns comprising of small and large rectilinear or irregular fields that most cases have straight boundaries, and which appear to have been created through the woodland clearance. Either border or occur in close proximity to areas of ancient woodland
Small irregular fields	Areas of small irregular fields that cannot be assigned to one of the other historic landscape character types. Includes small meadows and closes that do not occur next to settlement boundaries.

Piecemeal enclosure	Piecemeal enclosure can be defined as those fields created out of the medieval open fields by means of informal, verbal agreements between farmers who wished to consolidate their holdings. Within Staffordshire this process appears to have been well under way by the late medieval period, and was probably largely enclosed by the 16th century. These areas have field patterns comprised of small irregular or rectilinear fields. At least two boundaries will have 's-curve' or 'dog-leg' morphology, suggesting that that they follow the boundaries of former medieval field strips.
Re-organised piecemeal enclosure	Areas of either small irregular or rectilinear fields that have lost 10 or more field boundaries since the 1st ed. 6" map, OR areas of large irregular or rectilinear fields. In both cases there will be at least two field boundaries that exhibit 's-curve' or 'dog-leg' morphology. The field patterns in these areas result from the amalgamation of fields created through piecemeal enclosure. In most cases it can be demonstrated that this has occurred since the publication of the 1st ed. 6" OS map.
Drained wetlands	The field patterns in these areas can be small or large, irregular or rectilinear. However, most of their boundaries will be defined by the course of drainage ditches, and some field boundaries may also follow water courses. The drainage of wetlands was underway in Staffordshire by the 16th century, after which some of these more extensive areas began to specialise in livestock fattening. Some drained wetlands were brought into cultivation during the later 18th century and drainage operations and improvements continued into the 19th and 20th century.
Planned enclosure	These areas are characterised by either small or large fields that share very straight boundaries, giving them a geometric, planned appearance. Laid out by surveyors, these field patterns result from late enclosure during the 18th and 19th centuries. This historic landscape character type, therefore, includes commons that were enclosed by Act of Parliament.
Other small rectilinear fields	Areas of small rectilinear fields that cannot be assigned to one of the other historic landscape character types. Includes small meadows and closes that do not occur next to settlement boundaries.
Other large rectilinear fields	Areas of large rectilinear fields that have a significant number (i.e. as either predominant or secondary boundary morphology) of sinuous boundaries, and which can not be assigned to one of the other historic landscape character types. Includes some field patterns that have been created through the amalgamation of fields in the period since the publication of the 1st ed. 6" OS map.
Large irregular fields	Areas of large irregular fields that have a significant number (i.e. either predominant or secondary boundary morphology) of sinuous boundaries, and which cannot be assigned to one of the other historic landscape character types. Includes some field patterns that have been created through the amalgamation of fields in the period since the publication of the 1st ed. 6" OS map.
Very large Post-War fields	Very large fields (e.g. > 8.1ha and often significantly larger) created through the amalgamation of fields since the publication of the 1st ed. 6" OS map. Almost certainly the result of Post-War agricultural 'improvements' designed to meet the requirements of intensive arable cultivation.

Woodlands.

Historic Landscape Character Type	**Description and interpretation**
Broadleaved ancient woodlands	Woods that the Forestry Commission have identified as being broadleaved, and which English Nature has designated as being 'Ancient Semi-Natural'. This category will include the oldest woods in the county, some of which date to at least the medieval period. They may also contain well preserved archaeological monuments and relict landscapes dating to the Roman and prehistoric periods.
Mixed ancient woodlands	Woods that the Forestry Commission have identified as being mixed, and which English Nature has designated as being 'Ancient Semi-Natural'. This category will include the oldest areas of woods in the county, although some parts may have been planted with coniferous species. They may also contain well preserved archaeological monuments and relict landscapes dating to the Roman and prehistoric periods. Woods that the Forestry Commission have identified as being mixed, and which English Nature has designated as being 'Ancient Semi-Natural'. This category will include the oldest areas of woods in the county, although some parts may have been planted with coniferous species. They may also contain well preserved archaeological monuments and relict landscapes dating to the Roman and prehistoric periods.
Replanted ancient woodlands	Woods that have been designated as Ancient Semi-Natural by English Nature but which the Forestry Commission has identified as comprising of conifers or 'young trees'. Consequently, these woods are likely to have been clear-felled and replanted during the 19th or 20th century.

Broadleaved woods with sinuous boundaries	Woods that the Forestry Commission has identified as being broadleaved which also have sinuous boundaries. Although not designated as 'Ancient Semi-Natural', some are likely to represent fragments of older managed woodland.
Mixed woods with sinuous boundaries	Woods that the Forestry Commission has identified as being mixed which also have sinuous boundaries. Some may represent stands of much older woodland that have been colonised by or partially planted with conifers.
Coniferous Woodland with sinuous boundaries	Woods that the Forestry Commission has identified as being coniferous which also have sinuous boundaries. In many cases these are likely to represent plantations.
Other woods with sinuous boundaries	Woods that either have no Forestry Commission designation (e.g. because they are < 2ha in size) OR have been identified as either having been felled or as consisting of young trees. However, the boundaries of the woods are predominantly sinuous.
Broadleaved plantation	Woods that the Forestry Commission has identified as being broadleaved, where the wood's name and/or straight boundary morphology suggests that it has been planted in the 19th or 20th century (the latter can be identified by absence from the 1st ed. 6" map).
Mixed plantation	Woods that the Forestry Commission has identified as being mixed, where the woods name and/or straight boundary morphology suggests that it has been planted in the 19th or 20th century (the latter can be identified by absence from the 1st ed. 6" map).
Coniferous plantation	Woods that the Forestry Commission have identified as being coniferous, where the woods name and/or straight boundary morphology suggests that it has been planted in the 19th or 20th century (the later can be identified by their absence from the 1st ed. 6" map).
Other plantation	Woods that either having no Forestry Commission designation (e.g. because they are < 2ha in size) OR have identified as either having been felled or as consisting of young trees. However, the woods name and/or straight boundary morphology suggests that it has been planted in the 19th or 20th century (the later can be identified by their absence from the 1st ed. 6" map).

Water and valley floor.

Historic Landscape Character Type	**Description and interpretation**
Miscellaneous floodplain fields	Fields on river floodplains that do not fall into any of the more diagnostic Fieldscapes categories. The fields in these locations will traditionally have been used as meadows. By the mid 17th century the lush pastures in these areas were being used to fatten cattle. They may possibly preserve earthwork remains of water meadows
Moss/ raised bog	Areas of unimproved peats. In most cases peat formation will have began in the prehistoric period. The acidic conditions in these environments favour the preservation of organic remains and, as a result, these areas often preserve high-quality palaeoenvironmental and archaeological evidence. Truncation of the uppermost layers may have occurred due to peat cutting in the historic period. These also sustain ecologically rich wetland habitats.
Artificial lake/pond	Lakes or ponds that can be recognised as being artificial by the presence of retaining earthworks and/or dams. This category includes ornamental lakes, recreational facilities (e.g. modern fish ponds), flooded quarries and ponds associated with former industrial activity.
Reservoir	Artificial bodies of water created specifically for the purposes of water supply and which are marked as such on current maps. In Staffordshire these will generally date to the latter half of the 20th century
Natural open water	Expanses of open water over 1ha which have a natural origin. In most cases they will occupy basins that were formed during the last glaciation, although water levels may well have fluctuated over the course of the Holocene.

Industrial.

Historic Landscape Character Type	**Description and interpretation**
Industrial complex	Modern industrial complexes. Includes industrial estates, large factories and sewage farms. Most will date to the latter half of the 20th century.
Active stone quarries	Stone quarries that are in active used. Will usually comprise of very large modern quarries run by aggregates/ construction companies.
Abandoned stone quarries	Disused stone quarries. This category will usually consist of larger quarries created during the 19th and early 20th centuries.
Colliery Active	Areas marked on the 1:10,000 OS as working collieries.
Colliery Inactive	Areas marked on the 1:10,000 OS map as abandoned colliery sites.

Gravel Quarries Active	Gravel quarries that are in active used. Will usually comprise of very large modern quarries run by aggregates/ construction companies.
Gravel Quarries Inactive	Disused gravel quarries. This category will usually consist of larger quarries created during the 19th and early 20th centuries.
Derelict Industrial Land	Land upon which industrial activity has taken place during the 19th and 20th centuries but has since been cleared and not put to any obvious subsequent use.

Military.

Historic Landscape Character Type	**Description and interpretation**
Former ordnance depot now used for other purposes	Areas given over to the storage of ammunition during the Second World War but are now used for other purposes (e.g. storage, industrial units etc.), although the military architecture continues to form the dominant historic landscape type.
Abandoned ordnance depot	Areas given over to the storage of ammunition during the Second World War which have been abandoned but continue to form the dominant historic landscape type.
Barracks	Current military bases. In most cases these will have been built during the 20th century.
Airfield	Areas marked on the 1:10,000 OS map as Airfields used for military purposes. Some of these may have been abandoned, although military architecture and ground layout survives, and so continues to form the dominant historic landscape type.
Other Military	Current military bases either in current use or abandoned which do not fall into any of the above criteria. In most cases these will have been built during the 20th century.

Ornamental, parkland and recreational.

Historic Landscape Character Type	**Description and interpretation**
Parks and gardens	This category includes all parks and gardens that can still be identified in the present day landscape. In most cases these result from emparkment during the post-medieval or 19th century, although they may incorporate elements of medieval parks (e.g. deer parks).
Golf course	Modern golf courses identified as such on current maps.
Sports fields	Modern sports fields identified as such on current maps.
Other parkland	Others forms of parkland, recreational or ornamental landscapes that do not fall into any of the above categories. This category includes playing fields, caravan parks and cemeteries.

Settlements.

Historic Landscape Character Type	**Description and interpretation**
Historic settlement core	Historic settlement cores suggested by morphology or data held in the HER. In most cases these represent the extent of the settlement either by the end of the medieval period OR by the beginning of the 19th century. The distinction between the two is made via the period category in the current historic landscape character component of the database.
Pre-1880s settlement	This category defines the extent of a settlement as marked on the 1st ed. 6" OS map. In most cases this will effectively define the historic settlement core. However, for those settlements with an identified Historic Settlement Core this category will provide a measure of settlement growth since the period defined by the historic core (e.g. either over the course of the post-medieval and 19th century).
Redeveloped pre-1880s settlement	This relates to those parts of a settlement that are visible on the 1st ed. 6" OS map that have been changed significantly over the past 120 years, either through substantial infilling or wholesale redevelopment
Post-1880s settlement	This category defines the limit of a settlement shown on the current 1:10,000 HLCA base maps. Where other settlement categories exist, it provides a measure of settlement growth over the past 120 years (i.e. since the 1st ed. 6" map).

Orchards.

Historic Landscape Character Type	Description and interpretation
Pre-1880s orchards	This category defines orchards that are marked on both the 1st ed. 6" map and the modern HLCA base map. Consequently, the orchards will date to either the post-medieval OR early-mid 19th century
Post-1880s orchards	This category defines orchards that are marked on the modern HLCA base map but not on the 1st ed. 6" OS map. Therefore, it can be demonstrated that these orchards must have been planted over the past 120 years.

Communications

Historic Landscape Character Type	Description and interpretation
Airfield	This category defines civil airfields; both abandoned and in current use, marked on the current 1:10,000 OS map.
Major Road Junction	This category defines major road junctions marked on the current 1:10,000 OS map.
Service Station	This category defines motorway service stations marked on the current 1:10,000 OS map.
Canal Locks/Basin	This category defines canal lock and sidings marked on the current 1:10,000 OS map.
Train Station/Sidings	This category defines train stations and large sidings as marked on the current 1:10,00 OS map.

APPENDIX B – Periods

The periods used throughout the projects is consistent and follows the period system used by the Historic Environment Record (HER) and is as follows:

Prehistoric – 500,000 BC to 42 AD
Roman – 43 AD to 409 AD
Early Medieval – 410 AD to 1065 AD
Medieval – 1066 AD to 1485 AD
Post Medieval – 1486 AD to 1799 AD
Industrial – 1800 AD to 1913 AD
Modern - 1914 AD to 1999 AD

PRN Number	Site Name	Record Type
00665 - MST665	Windmill, Burston	Monument

Documentary and field name evidence for the possible site of a windmill on prominent high ground to the north-east of Burston.

Monument Types and Dates

WINDMILL (POST MEDIEVAL - 1486 AD? to 1799 AD?)

Evidence DOCUMENTARY EVIDENCE

Description and Sources

Description

Windmill: The field names 'Great Windmill Hill' and 'Little Windmill Hill' are given on the 1845 Tithe map of Sandon. The area is prominent high ground and a map of 1682 showed a windmill here, although the exact location is now uncertain. <1> <2> <3>

PRN Number	Site Name	Record Type
00749 - MST749	Sandon Old Hall Moated Site, Sandon	Monument

A scheduled medieval moated site with a wet moat, located to the east of Great Sandon Deserted Settlement (Primary Record Number 00751).

Monument Types and Dates

FISHPOND (Norman to POST MEDIEVAL - 1066 AD to 1539 AD)
Evidence EARTHWORK
MOAT (Norman to POST MEDIEVAL - 1066 AD to 1539 AD)
Evidence EARTHWORK
MANSION HOUSE (POST MEDIEVAL to Victorian - 1547 AD to 1899 AD)
Evidence EXTANT BUILDING

Description and Sources

Description

Moated Site/Fishpond/Mansion: A rectangular moated site with adjacent moat. The moat is wet, 12-15 metres wide and 4 metres deep. The moat formerly enclosed a large, medieval, timber-framed house and originally had a drawbridge on its eastern side. <1>

The site is now occupied by a post-medieval country house. Home of the Sampson Erdeswick from 1338. <2>

A rectangular, wet homestead moat with outside dimensions of 330 feet by 312 feet. A spread bank is visible on the outside of the moat to the south, south-west and south-east. In 1854 a small section of the inner wall of the hall was all that survived of the old building. A 19th century engraving shows a large, timbered Elizabethan building within the moat. This appears to have become derelict in the mid 18th century. Fragments of brick and tile can be seen in the disturbed ground, and along part of the south side of the interior a scatter of stone, bricks and tile may be the remains of a length of wall. The western edges of the moat are lined with stone and the western arm is divided by a projecting piece of land, suggesting that the moat was remodelled in the 18th and 19th centuries. An external banks to the north of the western side may be associated with these alterations. Fishpond associated with the moated site. (SB, 17-Mar-2004) <3>

PRN Number	Site Name	Record Type
00750 - MST750	Church of All Saints, Sandon Park	Monument

A listed parish church, the earliest remains of which are 12th-or early 13th century in date. The church was largely rebuilt in circa 1300 and is of stone construction with tiled roof. It comprises a nave with aisles, chancel and a Perpendicular south-west tower (of 15th century date). The north aisle of the church was elaborately remodelled in 1851 as a family chapel of the Earls of Harrowby. Possibly on the site of an earlier church founded in the 11th century?

Monument Types and Dates

CHURCH? (Founded, (between) SAXON to Norman - 1000 AD? to 1099 AD?)

WALL PAINTING? (POST MEDIEVAL - 1675 AD)
- Evidence: ARCHITECTURAL COMPONENT

Description and Sources

Description

Church, supposedly of 11th century foundation. The core fabric is early 12th century. Much enlarged in the 13th century and altered in the 14th, 17th, 19th and 20th centuries. The tower is of 15th century date. Also an associated cemetery (churchyard) of possible medieval origin (see PRN 50663), which has the base and part of churchyard cross (PRN 50662) within it. <1>

An oblique aerial photograph shows the isolated church with the area of the deserted settlement (Primary Record Number 00751) to the north. (SB, 17-Mar-2004) <2>

The church was founded in the early part of the 12th century, but there may have been an earlier church. The church was given to Combermere Abbey in the late 12th century. The foundations stones are of 12th century date, with the 13th century outer walls built on them. This 13th century building was practically rebuilt on the 14th century. The church was greatly enlarged at a later date and a tower was added, probably in the late 15th century. The church was repaired in the 17th century and restored in 1835 and again in 1929. (SB, 17-Mar-2004) <3>

The remains of an ancient churchyard cross (Primary Record Number 50662) survives in the churchyard. (SB, 17-Mar-2004)<4>

PRN Number	Site Name	Record Type
00751 - MST751	Great Sandon Deserted Settlement	Monument

The earthwork remains of a deserted settlement. The settlement was established by the time of the Domesday (in 1086), but deserted during the 17th or 18th century. Excavation on the site revealed evidence of medieval buildings and a cobbled road.

Monument Types and Dates

DESERTED SETTLEMENT (Norman to POST MEDIEVAL - 1066 AD to 1539 AD)
Evidence EARTHWORK
FISHPOND (Norman to POST MEDIEVAL - 1066 AD to 1539 AD)
Evidence EARTHWORK

Description and Sources

Description

Deserted Settlement in the area to east of the Church at Sandon Park. <1>

The earthworks include a roadway, pond and house platforms. <2>

The site was excavated between 1717 and 1777, probably when the post-medieval Sandon Park was established. <3>

Several excavations have revealed pottery and the remains of medieval structures. <4> <5>

Several fishponds survive in the area of the deserted settlement. <not sourced>

The Domesday survey records land for 15 ploughs, with 8 acres of meadow and one league by half a league of woodland. There were eighteen villagers, eight of whom were smallholders, and it was valued at £6. (SB, 16-Mar-2004) <6>

The settlement is recorded as being deserted between 1539 and 1666. (SB, 16-Mar-2004) <7>

Aerial photographs show the area of the church (Primary Record Number 00750) and the land to the north where the settlement existed, another shows the associated moated site. (SB, 16-Mar-2004) <8>

The village was situated between the moat and All Saints' Church. It was called Great Sandon and there is a strong local tradition of it. The valley is though to have been an access route to Stone in medieval times and the village possibly became established here in consequence. Its disappearance may be attributed to the decline of the moated park and the establishment of the modern Sandon Park in the 18th century. An excavation in 1968/1969 recovered fragments of medieval pottery, the foundations of one or two houses and a cobbled road. Parish records show that the village was still located near the church 1633. Recent excavation confirmed the site to be near the church, but no evidence was found to indicate the date of its demise. The site of the village is visible in scarp slopes, averaging 0.5 metres high, under pasture. The main street, running north-east to south-west, at the foot of Black Hill, is lined with house platforms and garden plots, mainly on the south-east side. South-east of the church and individual scarp, measuring 1.6 metres high, may also have been part of the village, but no individual house platforms could be recognised. A survey of the site, carried out in 1974, shows the location of the road, house platforms and the site of a building as well as the site of a spring or well and the possible site of a pond. (SB, 16-Mar-2004) <9>

02212 - MST2203	Trent and Mersey Canal	Monument

The course of the Trent and Mersey Canal, constructed by engineers James Brindley and Hugh Henshall. The canal opened in November 1771.

Monument Types and Dates

CANAL (Built, (between) Georgian - 1766 AD to 1771 AD)

Evidence	COURSE OF
Evidence	EXTANT STRUCTURE

Description and Sources

Description

Canal: Trent and Mersey Canal authorised in 1766. Engineers James Brindley and Hugh Henshall. Opened November 1771. <1>

A large set of Ordnance Survey maps at a scale of 1:2500 show the extent of the Conservation Area which covers the whole of the route of the Trent and Mersey Canal through Staffordshire. See also the Conservation Area Booklet. (SB, 25-Feb-2004) <2>

A canal spur was identified running south-west to north-east, parallel to the old salt works buildings at Weston during an archaeological evaluation in 2007. No terminus for the canal spur was identified within the area covered by the excavation. (HC, 28/07/2008) <3>

The suggested site of a barrow at Shortwood Farm, Sandon and Burtson. It is considered likley that this is actually a duplicate of PRN 00475, plotted in the wrong place due to an innaccurate grid reference.

Monument Types and Dates

ROUND BARROW (BRONZE AGE - 2350 BC? to 701 BC?)
- Evidence CONJECTURAL EVIDENCE
- Evidence DOCUMENTARY EVIDENCE

(Alternate Type) NON ANTIQUITY (Unknown date)
- Evidence CONJECTURAL EVIDENCE
- Evidence DOCUMENTARY EVIDENCE

Description and Sources

Description

Possible Round Barrow: Reference to a mound surrounded by a ditch at Shortwood Farm. <1>

The description could be that of a barrow, but the location details are vague with a 7 figure national grid reference. Assumed to be near Shaw's Wood Farm. Furthermore the record makes reference to an excavation by Pape that he did not undertake. <1>

(Please see PRN 00475, a mound feature between 'Short Wood Barn' and Standon Hall at NGR SJ 795 355 (it is possible that the 7 figure NGR for this PRN had the '7' missing, and is therefore simply a duplicate of PRN 00475).

Extensive gardens and pleasure grounds set in a landscape park around Sandon Hall, work on which began in the mid to late 18th century. Sandon Hall Park is a Registered Park and Garden and includes among its documented designers William Ermes, John Webb and W. A. Nesfield

Monument Types and Dates

LANDSCAPE PARK (Established, (Circa) Georgian - 1770 AD)
Evidence BOTANICAL FEATURE

Description and Sources

Description

Landscape Park: A landscaped area around Sandon Hall. <1>

Extensive gardens and pleasure grounds set in a landscape park around Sandon Hall. Among the designers documented are William Ermes, John Webb and W. A. Nesfield. The park is roughly triangular and is divided into two halves by its main topographic and scenic feature, The Valley, which runs north-west to south-east. To the west of the Valley is Lower Park, Sandon Hall and the pleasure grounds, to the east is the High or Upper Park. Both Upper Park and Lower Park are largely permenant pasture with mature parkland trees. It is uncertain if the creation of the park began prior to 1776 when the Sandon Estate was sold to the Harrowby family. By 1778 William Emes had been brought in and had begun planting, which went along with the removal of hedges and fences, the digging of ha-has and the creation of the parkland sward. Work proceeded outwards along The Valley from the Hall, and by 1787 TheValley, the North Lawn and Icehouse Plantation, the perimeter pkantations and Black Hill Plantation were in existence. However, parts of Upper Park may have remained divided into fields as late as 1802. (SB, 17-Mar-2004) <2>

07751 - MST7813	Sandon Railway Station, Sandon	Building

A listed, disused Jacobean railway station, built circa 1848-1850 by the North Staffordshire Railway to the designs of H. A. Hunt. The station is of red brick construction with diapering of blue brick and stone dressings. The building has now been converted to a dwelling.

Monument Types and Dates

RAILWAY STATION (Victorian - 1848 AD to 1850 AD)
Evidence EXTANT BUILDING

Description and Sources

Description

(SB, 15-Nov-2004) The station was built in 1848 by the North Staffordshire Railway to the designs of H. A. Hunt. The building was sold by British Rail in the mid 1970's, and it suffered badly from neglect and vandalism. In the mid 1980's the building was converted into a private dwelling. <1>

50662 - MST12233	Churchyard Cross, Church of All Saints, Sandon	Monument

The remains of a churchyard cross of possible medieval date, which consists of the base and part of shaft. It is now used as part of a sundial.

Monument Types and Dates

CROSS (MEDIEVAL - 1066 AD? to 1485 AD?)

Evidence STRUCTURE

Description and Sources

Description

The base and part of the shaft of an ancient churchyard cross survive to the south of the church. The remains comprise of a crude, circular pedestal base of two steps which is partly buried. A circularsocket-stone with moulding around the upper edge, and the lower half of an octagonal shaft, 1 metre in height. It now serves as a sundail, with a sundail plate mounted upon it. PRN Number	Site Name	Record Type
50675 - MST12246	Sandon Lime and Flint Kiln	Monument

A listed, extant 'draw' type lime kiln, probably also used for calcining flint, which formed part of Sampson Handley's flint mill complex dating from the 1790's. The kiln appears to have gone out of use by the 1880's.

Monument Types and Dates

LIME KILN (Georgian to Victorian - 1791 AD to 1881 AD)
Evidence STRUCTURE

Description and Sources

Description

The Sandon kiln is thought to be a 'draw limekiln' with a single pot accessed from a steep slope on the same side of the kiln as the canal. The kiln stands 6 metres high and is constructed of brick. It was built on a level site, rather than up against a steep natural bank as is typical for this type of kiln. This meant that access to feed the kiln with raw materials would have required some sort of ramp or path. Archaeological excavation in 2003 revealed possible evidence of a track on the west side of the kiln which could have provided an alternative route from the canal to the drawhole, although it is thought that the main route would have been through the gate in the wall alongside the canal and across the yard in front of the smithy. The coal and other raw materials would have been transported to the site on the adjacent canal. The kiln was probably used for calcining flint as well as for producing lime and was included in Sampson Hadley's original flint mill complex, which dates from the early 1790's. There is documentary evidence relating to use of the kiln at Sandon throughout most of the 19th century, however, it does appear to have gone out of use by the 1880's. (SB, 24-May-2004) <1>

The limekiln was over-grown and partly filled with rubbish in 2002. (SB, 20-Aug-2004) <2>

The earliest record of Sandon Mill is a reference from 1292 to an existing watermill on the site adjacent to the current river channel. The mill was in use up until the 18th century. In the late 18th century it was superseded by a flint mill complex built by Sampson Handley on a new site adjacent to the Trent and Mersey Canal. This new complex also included a Limekiln and a Mill House (later called Sandon Villa). The flint mill supplied ground flint to the pottery industry, and was in use up until the 1860's. Sampson Handley sold the complex in 1830 due to bankruptcy probably due to the financial problems of his brothers. The mill was then taken over by Samuel Ginders, who moved to the mill house in the early 1830's. There are very few records of the activity of the limekiln. It was definitely a working kiln in 1832-1833, and probably supplied lime to the local estate for building and agricultural use, from the time when it was built in the 1790's. From the opening of the Railway in 1849 it probably became cheaper to buy the lime from larger kilns such as those at Froghall and it is therefore likely that this is when lime burning at Sandon ceased. The grinding of flint at the mill continued until 1865, as by this time competition from the steam driven mills from the Potteries meant that the flint milling business at Sandon had become less profitable. The mill was used as a flourmill for a short time, but by 1871 all milling at Sandon appears to have ceased. The buildings were then converted to residential use to provide a different source of income to the Sandon Estate. (SB, 05-Oct-2004) <3>

Cochrane & Co, Dudley Manufacturer

PRN Number	Site Name	Record Type
51849 - MST13267	Home Farm / Sandon Hall Farm, Sandon Park	Monument

A late eighteenth century model farm complex that was part of the estate of Lord Harrowby.

Monument Types and Dates

MODEL FARM (Established, Georgian - 1782 AD)
Multi Yard Plan (Established, Georgian - 1782 AD)
Regular Courtyard Plan (Established, Georgian - 1782 AD)

Description and Sources

Description

A late eighteenth century model farm complex that was part of the estate of Lord Harrowby. The complex was designed by S. Wyatt and is an excellent example of a model farm on an axial layout. The farmhouse and farm buildings are both listed at Grade II. (LH, 13-Dec-2007) <1>

Laid out around several, regular courtyards. (SB, 22-Nov-2012) <2>

Description and Sources

Description

A farmstead located within a small hamlet, laid out around a regular 'F' plan courtyard with additional detaching outbuildings and the farmhouse long side on to the yard. (SW, 17-02-2009) <1>

The listed farmhouse is of 17th century, timber-framed construction, although probably has an earlier core of 16th century date. (SW, 17-02-2009) <2>

The farmstead is still extant, with minor alterations and additions to its layout since the late 19th century. (17-02-2009) <3> <4>

PRN Number	Site Name	Record Type
53898 - MST17665	Burston Villa Farm, Burston	Monument

A farmstead probably associated with a mid 19th century corn mill (PRN 02240). The outbuilding ranges are laid out around a regular U-plan courtyard, and Burston Villa (PRN 07724) to the north may have functioned as the associated farmhouse. The outbuilding ranges are still extant, although may have been converted to residential accommodation.

Evidence DOCUMENTARY EVIDENCE

Evidence EXTANT BUILDING

Regular Courtyard Plan (Established, (between) INDUSTRIAL to Victorian - 1836 AD? to 1885 AD?)

U SHAPE PLAN (Established, (between) INDUSTRIAL to Victorian - 1836 AD? to 1885 AD?)

Description and Sources

Description

A range of outbuildings laid out around a regular U-plan courtyard. Burton Villa, to the north, may have functioned as the 'farmhouse' to the mill and outbuildings. (SB, 12-Apr-2010) <1>

The outbuilding range is not shown on the 1" Ordnance Survey mapping of 1836, but is depicted on the late 19th century 1st Edition Ordnance Survey mapping in association with a corn mill. (SB, 12-Apr-2010) <2> <3>

The U-plan range of outbuildings is still extant, although may have been converted to residential accommodation. <4> <5>

HOUSING NEEDS SURVEY REPORT

JULY 2010

RAHP *consultancy*

SANDON AND BURSTON PARISH COUNCIL

Table of Contents of Housing Needs Survey Report

EXECUTIVE SUMMARY: SANDON AND BURSTON HOUSING NEEDS SURVEY

Key Features and Main Outcomes

1. The parish has an unusual property tenure profile due to the large number of estate-owned private rented properties. But also there are few smaller, cheaper homes either to buy: there is a low turnover of open market and other stock partly due to their being a higher than average ageing population under-occupying larger houses. There is no housing association or local authority housing.

2. House prices are high in relation to the incomes of those in need: the cheapest or entry-level house sold in parts of the Parish in the past two years was a cottage for £114,000 but even this was unaffordable to local residents in need based on their incomes.

3. The survey has identified and recommended the need for a small scheme of 4 housing association homes for local people who need a home now or in the next few years, the need being for 2 and 3 bed units.

.

4. The proposed scheme should be a mix of 2 rented and 2 shared ownership homes.

5. Respondents cited 5 family members having recently moved away from the parish because they could not find a suitable home.

6 . Wanting to set up an independent first home, family break-up, needing a smaller home and property condition were all cited as reasons for needing housing.

7 .None of those households in need is on the Housing Register.

8. The majority (80%) of those in need have a household income of less than £16,000 per year.

9. All of the households recommended as eligible for the proposal have a strong local connection, ie live in the parish.

10. A strong majority, 73%, of all respondents would support the idea of building a small affordable housing scheme for local people in the parish.

11. The location and design of any proposal were seen as critical issues.

12. All households in the parish were surveyed to assess local housing need: a very good response rate of 26% was achieved.

SANDON AND BURSTON PARISH COUNCIL; Housing Needs Survey

July 2010

SURVEY REPORT

SECTION ONE: BACKGROUND AND GENERAL INFORMATION

Introduction

1.1 Following a presentation to the Parish Council February 2010, the Parish Council commissioned Housing Plus to carry out a Housing Needs Survey to determine whether or not there is a need for affordable housing for local people in the Parish.

1.2 The motivation and reason for the survey is best expressed perhaps by the following extract from the Parish Council's covering letter which was sent along with the survey questionnaire:

> *Provision of Affordable Housing could help local people of all ages to remain in the community when the necessity arises…It is an important issue for all communities with the limited opportunities for housing development in rural areas…*

1.3 The survey and this report has been conducted and produced by RAHP consultancy without the Borough Council officers, Housing Association officers or Parish Council members having had sight of any data or had any input into the content of the report. Thus the report and the findings are an independent and impartial commentary based on the evidence collected.

1.4 The survey has been carried out at no financial cost to the Parish Council. The survey was funded by Housing Plus as part of its remit to explore the need for affordable housing in certain parts of rural Staffordshire.

1.5 This survey is the most comprehensive study of housing need undertaken in the Parish. Whilst some households will already be on the Council Housing Register, many may not be included on existing records of need. This survey also raises awareness of housing issues facing local people and gave respondents space to express their views on local housing issues.

1.6 The findings in this report are based on the survey only. They should be read in conjunction with other Borough-wide housing needs surveys, the housing market assessment, affordable housing and planning policies (www.staffordbc.gov.uk) to place the conclusions in a district-wide, sub-regional and regional context.

1.7 For a wider overview of the national rural housing problem, reference should be made to the findings and recommendations of the Government's Affordable Rural Housing Commission Final Report, May 2006 (www.defra.gov.uk) and the Matthew Taylor Report (www.clg.gov.uk).

2. Survey Purpose and Methodology

2.1 The purpose of the survey was to acquire detailed information about the current housing situation and the numbers and types of households in housing need and to find out what kind of alternative housing they were seeking. Also, it gave people an opportunity to express their views on what was or was not needed.

2.2 Although based on a core questionnaire, the survey form (a copy is appended to the report) was agreed by the Parish Council in its final form before distribution. The survey form was divided into two parts: Part 1 collected general information about the respondent's household and Part 2 was for completion by those in housing need. Also the questionnaire included an explanatory section on what is meant by affordable housing as it can be provided by housing associations together with a case study of a previous beneficiary now living in a home on a small rural exception site.

2.3 An important element in the design of the form was to reveal what is called hidden or concealed households, people who cannot afford to be in the housing market and are living within another household.

2.4 The forms were posted to all households in the Parish using address data from the Council Tax Register. They were returned in prepaid freepost envelopes to Housing Plus and forwarded unopened to RAHP for analysis.

2.5 The data processing was carried out by RAHP research assistants.

2.6 As the questionnaires went to 100% of households, this is a total or census survey rather than a sample survey. This methodology is that recommended* as being appropriate for rural areas in that from the usual borough-wide sample surveys, rural wards are grouped together and as such it is not possible to disaggregate information for individual villages or parishes. There is a presumption (*Source: A Guide to Housing Needs Assessment, IOH 1993*) that there will be a greater response from those in need using this methodology. The results are presented as found (no figures have been 'grossed up').

*Assessing Housing Need in the South East – A Good Practice Guide (SEERA 2004)

2.7 It should be noted that a few respondents did not answer all the questions asked. Percentages quoted are based on responses received for that particular question.

2.8 It is possible; indeed likely, that a degree of housing need occurs within the households that did not respond to the questionnaire and therefore the need identified in this report could be an under-representation of the real situation. The actual figures from the survey can be classed as demonstrable need.

2.9 Some information has also been cross-referenced to the Census, the HM Land Registry parish-based data from web-based sites and the Office of National Statistics.

2.10 It is hoped that this report is clear and readable. But some terms have differing definitions, not least '*What is affordable housing?'*

We have used

Housing provided with subsidy so the asking price or rent can be substantially lower than prevailing local market prices or rents, ensuring it stays affordable for those who cannot afford market housing.

The terms house and housing used in this report refers to all types of residential property including flats, bungalows, sheltered accommodation etc unless otherwise stated.

3. Response to Survey

3.1 Of the 170 questionnaires distributed, 45 were processed, a 26% response. The response rate is very good for such a survey and is large enough to have good statistical validity.

Population figures from the Census update of 2004 show that about 363 people live in the Parish with an average household size of 2.39. The 170 forms distributed equate to the Council Tax Register records for the number of households, validating this as a 100% survey. The 45 survey forms returned represent a survey population of 103 people giving an average household size of 2.29 people which equates well with the total Parish average from the Census update, again validating this as a representative survey.

3.2 The following sections of the report analyse the key features and present the key findings from the data analysis. Appendix I is a copy of the survey form and the Parish Council's covering letter.

3.3 The survey was carried out for three weeks in June before the questionnaire return date of June 28th, 2010. The date was extended for a further two weeks to allow for late returns before data processing and analysis commenced.

SECTION TWO: THE SURVEY FINDINGS

4. Current Housing Situation – Key Features

4.1 Part 1 of the questionnaire was completed by all households whether or not there was any housing need so as to build up a picture of the current housing situation.

The Population

4.2 The 45 households replying to the survey contain a total population of 103 of which 14% are children aged less than 15, 9% are aged 16-24, 14% aged 25-44, 36% aged 44-65, with the remaining 27% over 65. Making a broad comparison with some national figures – 20% under 15 and 16% over 65 for 2003 (source: Office of National Statistics www.statistics.gov.uk), the conclusion is that the Parish has less young people and significantly more elderly people than the national average.

Based on the survey information, the key changes since the last census are that the numbers of children and young adults have fallen by 2% while the percentage of over 65's have risen by 12%.

The overall profile depicted for the parish is similar to that profiled for rural villages in The State of the Countryside Report 2009 (Commission for Rural Communities), where the out-migration of younger people partly due to lack of affordable housing and un-affordability of market housing, and the in-migration of affluent families and retiring older people and an ageing resident population is apparent.

The Housing Stock and Tenure

4.3 All of the housing stock is houses (87%) or bungalows (7%) with a further 6% describing their homes as cottages or barn conversions. Of this stock 93% is 3 or 4 bedroom accommodation with only 7% as 2 bedroom homes. With the demographic trend towards smaller households, the lack of 1 and 2 bed units will make it difficult for younger people in particular, whether single, couples, small families as first-time buyers or those on lower incomes to enter the housing market either by affordability or lack of supply: none of the homes in the survey are 1 bed units. Despite the number of larger houses, a significant number are occupied by one or two people: these tend to be 'empty-nesters' – people whose children have grown-up and left leaving under-occupying parents.

4.4 The tenure profile for the parish is very unusual. A total 62% of respondents are owner-occupiers, with a highly significant percentage (67% of that figure) owned outright without a mortgage, typical of an older population, reinforcing the issues as highlighted above. But the private rented sector and tied accommodation, mostly through private estate ownership, represents the rest of the tenures (38%) and probably presents limited opportunities for those on lower incomes unable to access the open

market or to rent within the parish, private sector rents being significantly higher than for local authority or housing association homes of which there are none in the parish.

Property Turnover

4.5 The question on length of residency shows that 64% of respondents have lived in the parish for over 10 years with a further 11% of households being resident for 5-10 years. This represents a stable community, a low level of development and a low turnover of property. If this low availability of property is added to the poor potential supply of smaller units as indicated above, the possibilities for local people on lower incomes who wish to remain in the parish, or indeed those who may wish to return, appear very limited. The analysis of local affordability in a following section will amplify this problem.

Housing Need and Out-Migration

4.6 The survey data shows that there are 5 respondents (representing 12 people) with someone needing a different type of accommodation now or within the next 3 years. All of these households completed Part 2 of the form as wanting to remain in the parish.

4.7 Directly connected to the above, respondent households report 5 family members having had to move from the Parish due to difficulties in finding a suitable home locally in the last two years. This represents some out-migration and is indicative of a lack of affordable housing to rent or buy. Given the very low percentage of the survey population aged 16-24, only 9%, and this being the age group most likely to be looking for their first home, and an affordable home, there is an indication here that this is a trend which the Parish Council may wish to address: the housing needs analysis in detail below will further justify this.

5. Level of Support for a Small Development of Affordable Housing

5.1 One of the purposes of the report was to establish the level of local support for a possible new scheme. Question 6 on the questionnaire asked: "*Would you support a small development of affordable housing in the Parish if there was a proven need from households in the Parish or with a genuine local connection?"*

All 45 respondents answered the question.

73% said 'Yes': 27% said 'No'.

5.2 Numerically, this represents a very strong majority who would support the Parish Council if a small development were needed. But many respondents backed up their decision by adding comments and I have included these as verbatim transcripts in Appendix II.

I have made no judgement nor attempted to attach any weight to these findings either way, preferring to leave such local opinion to be considered by the Parish Council.

6. Housing Need

6.1 Part 1 asked households if they or anyone living within the household needed separate accommodation now or in the near future. Some 5 respondents completed the question with all of those respondents completing most of Part 2 as needing a new home in the next three years and wishing to live in the parish. What follows analyses the needs and situations of those households;

Local Connection

6.2 Of those respondents completing Part 2, 4 were completed by themselves as being in need and one was completed on behalf of family members needing separate accommodation.

It is worth emphasising here that strong local connection criteria would be rigidly enforced should a scheme be proposed and advanced.

6.3 In addition, as indicated in 4.7 above, survey responses identified 5 people that have moved away in the past two years because of difficulties finding a suitable home. It is not known whether these people are still in housing need or they may have settled into alternative accommodation elsewhere.

Current Tenure

6.4 In terms of the current tenure of those households in need, 1 is living within a home owned or rented by their parents, a concealed household, 1 owns their own home and a further 3 households rent from a private landlord.

Preferred Tenure

6.5 Of preferred tenure of first choice, 2 would prefer to rent from a housing association, 2 require shared ownership but also expressed an equal preference to buy on the open market. Private rented accommodation is a first choice for 1 household.

It would seem that a preference for buying on the open market does not reflect an air of reality in terms of financial capacity. The following section on affordability will echo and demonstrate that most who aspire to open market purchase can often, at best only afford shared ownership.

Households on the Housing Register

6.6 None of the Part 2 respondents is already on the Housing Register. Should any other households wish to qualify for any possible future scheme, they would need to go on the Housing Register.

The Housing Register process in the Borough currently does not identify need by local connection. Close examination of their data may reveal other households who may qualify.

Household Composition

6.7 In terms of household composition, for the 5 households completing part 2 of this question, there is 1 single person over 60; 1 couple under 60; 1 family with children and 2 single parent families.

Reasons Accommodation Needed

6.8 The main reasons for needing to move fall into several categories with wanting to start a first home, needing a smaller home, to be nearer family and family break up all given in equal measure as significant reasons for needing a new home. Several comments regarding the state of repair of private rented property and high rents on such were also cited.

Size of Accommodation Required

6.9 In terms of the size of accommodation required, one 1-bed, one 2-bed and three 3-bed homes are required with seven children in the latter family homes.

6.10 One household would require special care or support because of a mental health or learning disability.

7. Affordability

7.1 It is best perhaps to approach this issue by revisiting the preferred tenure of those in housing need, and comparing this to financial information provided.

Rent

7.2 For the households which would prefer to rent from a housing association, the spectrum of rents for a 1-bed to a 3-bed unit would lie from £50 - £150 per week: from the financial information provided the households wanting this form of tenure could afford this

Shared Ownership

7.3 Some 3 households indicated an interest in shared ownership and it maybe that 2 households could be eligible for shared ownership housing as they may have a sufficient deposit. But most households in need (80%) have a gross income of less than £16,000 per year. This figure is well below the generally accepted threshold, £26,000, above which a household might be considered to be financially eligible for a shared ownership property, usually taking out a mortgage on 40% of the equity as an entry level and paying rent on the balance (based on 40% of a home valued at £200,000).

Open Market

7.4 For those households expressing an interest to buy on the open market as a preferred first option, the issues in Sandon and Burston are as follows.

Using HM Land Registry data on parish house sales (www.nethouseprices.com), using the relevant postcode areas, for the two years to February 2010 there were no sales, reflecting the national economic downturn. In 2008, based on three sales, the average house price was £364,000. In March 2010, a cottage was sold for £114,000.

So taking the cheapest house sold, i.e. what would be the open market entry level price, assuming a 95% mortgage at 3.5 joint income (although it is recognised that in the current mortgage lending climate such a deal may not be available with higher deposits being required), a household would need a gross income of around £31,000 and a deposit of £6,000 to afford the latter property.

Of the survey respondents, 2 households may have such savings or equity for a deposit but only 1 the required income – to repeat the above figure, 80% of those in need have a household income of less than £16,000 per year. So for most households preferring to buy on the open market, the prospect is that most will be unable to do so and the options are that they will need to consider moving to a cheaper area, staying in their existing home or investigating a different tenure such as renting or shared ownership. Local house prices and the supply of houses on the open market clearly present a gap

between aspiration and attainment for those in need who wish to buy on the open market.

Economic Status and Travel

7.5 All households have someone in work and all travel to work by car.

SECTION THREE: THE WAY FORWARD

8. Conclusions

8.1 Though most households are satisfied with their housing situation, there is a demonstrable unmet housing need from local people for 4 units of affordable housing as quantified below.

8.2 The unmet need is a product of a low turnover of relatively large expensive open market housing in the parish which excludes those local people on lower incomes from gaining access to this market should they wish to stay in the parish. Some 80% of households in need have average incomes of less than £16,000 which represents a problem in an area of high property values. There is no affordable social rented housing or for shared ownership to meet the need. The only other choice in the parish is private renting of estate-owned property.

8.3 There is a very strong overall majority (73%) level of support for a small scheme from the local community to satisfy this need for affordable housing for local people in the parish.

8.4 Of the 5 households expressing a housing need, one only indicated a preference for open market housing and as this is cannot be provided by a housing association, I have concluded that a scheme of 4 homes should be considered.

8.5 Based on the financial information provided, 2 shared ownership homes are recommended and such provision would provide the opportunity for these households to get on the so-called housing ladder. The reservation to this recommendation is that further financial scrutiny would be needed should any proposal be advanced.

8.6 There are several reasons for needing accommodation and equal regard should be given to the reasons as detailed in paragraph 6.8 above.

8.7 The size of the proposed affordable housing scheme is given below. But explanation is needed in that although one unit as a 1 bed unit was required, Housing Plus are reluctant to develop such units because providing 2 bed units allows for more flexibility. For example, a young couple in a one bed unit may subsequently have a family thus requiring a two bed home; hence the preference for developing two bed homes removes the need for subsequent transfers due to overcrowding.

8.8 Given all the factors in this report, an affordable housing scheme for local people as detailed below would be appropriate for families with children, couples and single people, subject to planning and funding implications:

Proposal: 4 affordable homes for local people

Sizes: 2 x 2-bed (one rented and one shared ownership)
2 x 3-bed (one rented and one shared ownership)

8.9 It could be considered that a scheme of the above size would not have too significant an impact on either Sandon or Burston were it well-sited and well-designed, and would not have too large an impact on the physical landscape (currently 3 of those in need live in Sandon and one in Burston).

8.10 It should also be remembered that a housing needs survey is only a snapshot of the given need at any one time and while the scale of need is not likely to change, by the time any possible future scheme is likely to be achieved, the mix and size of units would need to be cross-referenced with the Council Housing Register to show emerging need with a local connection at that time.

9. Recommendations

9.1 It is recommended that the Parish Council consider advancing the process to achieve an additional small scheme of affordable housing as proposed above by:

1. Accepting the findings of this report

2. Engaging with the Council and Housing Plus to explore the potential for programming such a scheme and funding by the Homes and Communities Agency.

3. With Housing Plus, exploring potential locations and availability of any sites which the Parish Council may think appropriate.

Appendix II

Residents' Views on Affordable Housing

Yes

- Small flats for elderly to free other accommodation
- It should be every British person's right to have an affordable home and not be forced into buying a roof over their heads with prices set by greedy developers, estate agents and house sellers. People should be able to rent properties from the local council or housing association which the average wage can cover and not be forced into negative equity and despair at the whim of the interest rate. A rented property also gives young couples a chance to save and make proper decisions on buying a house if that is their wish, not forced into it because that's the only way they can get a house. This must be the only country in Europe that houses the population by private development - a realignment of properties is long overdue, something successive governments have not had the guts to do since the demise of Margaret Thatcher.
- Definitely. In a grace and favour village like Sandon it is important that homes are available for the children of tenant farmers otherwise the village will die.
- Infilling empty spaces
- I would like to rent a more affordable home as a single mother of two. I currently rent from the Harrowby Estate but the properties are very run down and the rent is quite high. The maintenance of the properties is of a very low level.
- Our daughter and her partner would like to live nearby but at present cannot afford a property.
- Yes, for older residents.

No

- I don't feel that the parish has suitable amenities to support further residents
- No development in Burston
- Any building development in the village spoils the unique qualities that we moved here for in the first place, ie small, quiet hamlet.
- The A51 is busy enough as it is without more cars using it as a result of more housing being built in the area.
- Burston and Sandon are both small villages with few young people. I do not believe that there are many if any who need affordable housing. Burston has two properties in the village on sale for 2 years and are both affordable by today's standards.

1.0 Introduction

This flood risk assessment has been prepared by RAB Consultants, in support of a proposed change of use of an existing building at Burston Hall, Burston, Staffordshire.

Planning Policy Statement 25: Development and Flood Risk (PPS25) requires a flood risk assessment to be carried out to ensure that new development is safe from flooding and will not increase the risk of flooding.

2.0 Site Location

The proposed site is at Burston Hall, Burston, Staffordshire, ST18 0DR (see location plan in Appendix A).

Access to the site is via Burston Lane and the entrance to the site is large enough for vehicular access.

3.0 Site History and Development Proposals

The site at present consists of a two storey outbuilding and piggery. It is proposed to convert the outbuilding to one residential unit and associated works. The external appearance of the building will not be changed. A new access route is to be laid to the west of the outbuilding (Appendix B).

The site lies on the edge of flood zone 3a and within flood zone 2 (Flood Map in Appendix A) and is classed as a 'more vulnerable' development in accordance with Table D.2 Flood Risk Vulnerability Classification of PPS25. The site is an 'appropriate development' in accordance with Table D.3 Flood Risk Vulnerability and Flood Zone 'Compatibility' of PPS25. The application is for a change of use and therefore is not subject to a sequential or exception test in accordance with paragraph D15 of PPS25.

4.0 Flood Risk

4.1 River Trent

The site is approximately 180m north east of the River Trent and lies on the edge of flood zone 3a (annual probability of flooding greater than 1%) and within flood zone 2 (annual probability of flooding between 1% - 0.1%). According to Environment Agency records, the 1% annual probability and the 0.5% annual probability flood levels for the site are 81.06m AOD and 81.25m AOD respectively (Table 1).

Table 1: Environment Agency's March 2009 River Trent Flood Mapping Study								
	Peak Water Level (m AOD)							
Annual Probability (%)	**20**	**10**	**4**	**2**	**1.33**	**1**	**0.66**	**0.5**
Cross section 3161413129	80.42	80.56	80.75	80.9	80.99	81.06	81.17	81.25

A topographic survey (Appendix C) of the site has been undertaken and ground levels at the site vary between 84.16m AOD and 85.40m AOD. The site is 2.91m – 4.15m higher than the 0.5% annual probability flood level of the River Trent. The development is therefore appropriate for this flood risk.

4.2 Climate Change

In making an assessment of the impacts of climate change on flooding from rivers, Table B.2 of PPS25 recommends a 20% increase on peak river flows. In the absence of specific modelled data from the Environment Agency, the 0.5% annual probability flood level shall be used for this assessment, i.e. 81.25m AOD.

4.3 Trent and Mersey Canal

The Trent and Mersey Canal (Figure 1) lies approximately 125m south west of the site at Burston Hall. The canal is situated between the River Trent and the site. British Waterways do not have any records of breaches or overtopping of this section of the canal (Appendix H).

Figure 1: Trent and Mersey Canal

Spot levels have been measured along the tow path of the Trent and Mersey Canal (Appendix C). These levels vary between 81.45m and 81.67m AOD, which is 0.2m – 0.41m higher than the 0.5% annual probability flood level of the River Trent. The canal therefore acts as a barrier preventing flood water

from the River Trent flowing north past the canal and up toward the site. The canal does not represent a flood risk to the site as it is also several metres lower than the site.

4.4 Previous Flood History

The current owners of the site have no knowledge of the site flooding in the recent past. The Environment Agency and British Waterways do not have any records of the site flooding (Appendix G and H).

4.5 Jolpool Brook

The Jolpool Brook is located approximately 90m to the north of the site (Appendix A). The Jolpool Brook is a tributary of the River Trent and is free flowing along much of its course. The Environment Agency was unable to provide any flood levels for the Jolpool Brook (Appendix G).

4.6 Catchment Description

The catchment area of the Jolpool Brook is 4.58km^2. It is a small, rural ungauged catchment, which is a tributary to the River Trent. Upstream of the site the brook flows through open fields (Figure 2), into a culvert under the railway line (Figure 4) and behind residential properties (Figure 3).

The Jolpool Brook flows underneath a bridge (Figure 5) adjacent to the site and then around the village pond. The brook flows into the River Trent a further 300m downstream of the site.

Figure 2: Jolpool Brook upstream of the site flowing through fields

Figure 3: Jolpool Brook flowing past residential houses

Figure 4: The culvert in which the Jolpool Brook flows under the railway

Figure 5: The bridge adjacent to the site

4.7 Methodology

The Flood Estimation Handbook (FEH) has been used to estimate the flood flows in the Jolpool Brook at Burston Hall using the revised 2007 CEH Wallingford statistical method. Details are included in Appendix E.

As there is no gauge at the site, catchment descriptors have been obtained from the FEH CD-ROM and used to determine QMED at the site. QMED has then been adjusted using the revised CEH Wallingford method and a local donor site, the River Dove at Rocester Weir.

A pooling group for the site was obtained using the UK Hiflows sites suitable for pooling, version 2.2.1. The pooling group was reviewed and adjusted and it was determined that the revised group was an acceptable, possibly heterogeneous group. A generalised logistic distribution was applied to the pooling group to determine flow estimated up to the 1% annual probability using 526 years of data.

The revised statistical method was then compared to the Revitalised FSR/FEH Rainfall Runoff (ReFH) method and the IH124 method. The ReFH method has been chosen as the preferred method of calculating flows for the Jolpool Brook because it gives a more conservative estimate than the other statistical methods used.

Using the ReFH results, the 0.1% annual probability flow has been extrapolated using a logarithmic trend (Appendix D). The flow has been estimated to be approximately 5.4m^3/s. This flow will be used to estimate the extent of flood zone 2 of the Jolpool Brook.

4.8 Flood Flows

Catchment descriptors from the FEH CD-ROM are listed in Table 2 below.

Table 2: Catchment Descriptors	
Descriptor	**Value**
AREA	4.58km^2
URBEXT$_{2000}$	0.0068
SAAR	775mm
FARL	1.000
SPRHOST	32.9

Details of the flow estimation methods used are provided in Appendix E. The estimated flood flows using catchment descriptors and the ReFH method up to the 150 year return period are summarised in Table 3. The 100 year return period has been increased by 20% to allow for climate change in accordance with Table B.2 of PPS25.

Table 3: Estimated Flood Flows	
Annual Probability (%)	**Estimated Flow (m^3/s)**
50	**1.5**
20	**2.0**
10	**2.4**
4	**2.9**
2	**3.4**
1	**4.0**
1 + 20% cc	**4.8**
0.66	**4.4**
Extrapolated 0.1%	**5.4**

5.0 Predicted Extent and Depth of Flooding

5.1 Methodology

A simple Hec-Ras model of the Jolpool Brook has been constructed (see CD with 'Burston Hall FRA' file) using topographic survey sections included in Appendix C. The model includes a culvert and a bridge (modelled as a culvert) and begins approximately 79m upstream of the culvert. The model extends a further 293m downstream of the culvert. The dimensions of the culvert have been provided by Network Rail (Appendix I).

Cross sections 7.9 to 7.1 have been interpolated using cross sections 7 and 8. Two weirs are located between cross section 7 and 8, the cross sections from the survey have not picked up the detail of the weirs, therefore cross sections 7.3, 7.5, 7.7 and 7.9 have been interpolated to mimic the fall in water levels at each weir. The results from section 4.8 have been used to estimate flows down the Jolpool Brook within the Hec-Ras model (Appendix F).

It is possible that the River Trent could back up the Jolpool Brook during an extreme flood event. However, it is likely that the Jolpool Brook catchment will peak before the River Trent and therefore the model only considers flooding directly from the Jolpool Brook.

5.2 Sensitivity Analysis

A sensitivity analysis has been undertaken by increasing/decreasing the manning's 'n' value by 10% on the Jolpool Brook model. The analysis shows that the model is not very sensitive to the roughness (+/- 50mm maximum) coefficient throughout the model (see Table 4).

Table 4: Sensitivity Analysis for the Jolpool Brook

Model Section	'n' -10%	1% + 20% normal 'n'	'n' +10%
11	88.26	88.26	88.26
10	86.74	86.74	86.74
9	86.25	86.29	86.33
8	86.07	86.10	86.12
7.9	85.83	85.83	85.83
7.7	85.66	85.69	85.72
7.5	85.37	85.42	85.37
7.3	85.45	85.48	85.45
7.1	85.36	85.37	85.36
7	85.32	85.32	85.32
6	84.75	84.75	84.75
5	84.51	84.51	84.52
4	84.28	84.28	84.28
3	83.87	83.87	83.89
2	83.62	83.62	83.62

5.3 Results

Estimated flow levels have been used to calculate water surface elevations at each of the cross sections on the Jolpool Brook. Table 5 provides a summary of these water surface elevations.

Table 5: Flood levels for the Jolpool Brook

Model Section	Annual Probability (%)						
	10	4	2	1	1 + 20%	0.66	Extrapolated 0.1
11	88.08	88.13	88.19	88.25	88.26	88.28	88.37
10	86.24	86.34	86.44	86.56	86.74	86.65	86.94
9	86.07	86.13	86.18	86.23	86.29	86.26	86.33
8	85.88	85.93	85.98	86.04	86.10	86.07	86.14
7.9	85.58	85.66	85.72	85.77	85.83	85.80	85.87
7.7	85.12	85.48	85.51	85.60	85.69	85.64	85.75
7.5	85.11	85.16	85.32	85.42	85.42	85.42	85.43
7.3	85.11	85.20	85.35	85.45	85.48	85.46	85.50
7.1	85.01	85.11	85.28	85.38	85.37	85.38	85.37
7	84.95	85.06	85.25	85.35	85.32	85.34	85.29
6.5 Cul u/s	84.72	84.78	85.25	85.40	85.40	85.40	85.40

6.5 Cul d/s	84.44	84.49	84.62	85.39	85.39	85.39	85.39
6	84.52	84.57	84.62	84.67	84.75	84.71	84.80
5	84.44	84.44	84.44	84.45	84.51	84.48	84.56
4	84.11	84.16	84.20	84.24	84.28	84.26	84.31
3	83.74	83.80	83.84	83.82	83.87	83.85	83.89
2	83.38	83.43	83.48	83.60	83.62	83.61	83.64

The Jolpool Brook is approximately 90m north east of the site at Burston Hall. The cross sections between 8 and 6 are therefore the most relevant cross sections to the site. The model illustrates that the flood flows at cross sections 8, 7 and 6 do not reach the top of the left bank and therefore would not affect the site purely on their own. However, the model suggests that the bridge at cross section 6.5 Cul u/s and 6.5 Cul d/s could cause flood water to travel out of bank (Table 5).

A spot level has been taken on the upstream side of the bridge where water could come out of bank (85.44m AOD), however it is unlikely that flood water will be able to travel out of bank towards the site. In the unlikely event that the flood water did reach this height (85.44m AOD) the water would travel along Burston Lane and pool at a low point (84.69m AOD) in the road located to the west of the bridge, adjacent to the pond. This water would not reach the site as there is an overland flow route across the fields to the River Trent between the site and the Jolpool Brook.

5.4 Recommended Finished Floor Levels

There is limited scope to change the floor level within the building as this development is a change of use. Raising the floor level to 600mm above the 1% plus climate change level would be impractical due to limited floor to ceiling heights of the building, create access problems and would not be in keeping with the street scene. Therefore it is recommended that the finished floor level be kept at 85.25m AOD.

A flood resilient design will be undertaken, for example, raising electrical circuitry 0.6m above the 1% plus climate change flood level and using flood resilient materials throughout the building. It is understood that the building already has concrete floors.

More detailed information can be found at the Environment Agency's website (www.environment-agency.gov.uk) and in 'Improving the flood performance of new buildings' (www.planningportal.gov.uk/uploads/br/flood_performance.pdf).

5.5 Safe Access and Exit

Safe access and exit will be maintained during an extreme flood event. Residents of the property would be able to travel north along Burston Lane towards Butterhill Bank and Lichfield Road. In the unlikely event that floodwater travels out of bank at the bridge, it is likely that the water will flow

down Burston Lane and pool at a low point (84.69m AOD) in the road near the pond, highlighted on the map in Appendix C. It is unlikely that the floodwater would reach the site during an extreme event, as it is likely that the water will flow into the fields adjacent to the site and travel south towards the River Trent.

6.0 Surface Water Runoff

The site is currently impermeable hard surface, the development may provide an opportunity to introduce sustainable drainage techniques to minimise runoff from the site.

6.1 SUDS – Sustainable Drainage Systems

Paragraph 1.3.2 from the SUDS manual (C697) discusses the SUDS 'management train', which is intended to mimic the natural catchment process as closely as possible. Table 6 gives examples of the hierarchy of techniques that can be used to achieve the management train.

Table 6: Hierarchy of techniques and their descriptions

Technique	Description
Prevention	The use of good house design and housekeeping measures to prevent runoff and pollution; rainwater reuse/harvesting
Source control	Soakaways, porous and pervious surfaces, water butts, green roofs
Site control	Routing water to large soakaways, infiltration or detention basins
Regional control	Balancing pond, wetlands, swales, retention ponds

Due to the size of the site and that the proposal is to change the use of the building on the site, there are a limited number of techniques which would be feasible to use for this type of development. Site and regional control techniques are not considered feasible due to the small size of the proposed development and as the proposal is for a change of use. Table 7 illustrates the feasibility of the SUDS techniques that could be available at the site.

Table 7: Feasibility of techniques at the proposed site

Technique	Issues	Feasible? Y / N
Prevention		
Good building design and rainwater harvesting	To ensure that drains and guttering are properly located and laid. Water butts could be incorporated into the design of the building to enable the reuse of rainwater for watering the surrounding garden and border area.	Y

Source Control		
Porous and pervious materials	Using porous and pervious materials on the proposed driveway is considered to be beneficial for surface water runoff.	Y
Soakaways	The developer has the opportunity to dispose of surface water via soakaways. According to www.landis.org.uk/soilscapes the subsoil type for this area of the UK is classified as "slightly acid loamy and clayey soils with impeded drainage" which means there may be limited opportunity for infiltration. This soil may be satisfactory for soakaways but should be confirmed by a site investigation.	Limited
Green Roof	Although a green roof could offer a certain level of runoff betterment, it is not in keeping with the street scene of the surrounding area and is therefore not a viable option.	N
Site and Regional Control		
Infiltration / detention basins / balancing ponds / wetlands / swales / retention ponds	These techniques will be too large, costly and would not hold a great benefit to the surrounding area. There is limited scope to use these techniques outside the floodplain at the site.	Limited

In summary, the use of SUDS techniques are recommended for this development. There are a number of techniques that could be incorporated into the design of the development e.g. the use of water butts and pervious pavements. There will be no increase in surface water runoff at the site. The use of these techniques should be designed to provide some surface water betterment at the site.

7.0 Conclusion

The proposed site at Burston Hall lies on the edge of flood zone 3 and within flood zone 2. The proposal is to convert the outbuilding to one residential unit and associated works. The external appearance of the building will not be changed and a new access route is to be laid to the west of the outbuilding.

The source of fluvial flood risk at the site is from the River Trent and the Jolpool Brook. The site is between 2.91m – 4.15m higher than the 0.5% annual probability flood level for the River Trent, therefore the development is appropriate for the flood risk. The Trent and Mersey Canal lies between the River Trent and the site and acts as an additional barrier to protect the site from flooding from the River Trent.

The Jolpool Brook is a natural channel along much of its course. Flow estimations have been calculated using the ReFH method. There are no flood defences located along the Jolpool Brook. The model suggests that the site will not flood during a 1% plus 20% climate flood event.

The majority of the site currently consists of impermeable hard surface. The impermeable area of the site will remain the same with the proposed development and the new driveway will consist of permeable gravel material.

8.0 Recommendations

The following actions have been recommended;

- It is recommended that the finished floor levels are kept at the existing height of 85.25m AOD and that a flood resilient design is incorporated into the design of the building.

- The drainage design for the site should make best use of SUDS techniques e.g. porous pavements and water butts, where appropriate, to provide some betterment of surface water runoff at the site.

RAB Consultants

Flow Calculations for the Jolpool Brook at Burston Hall

Location

Burston Hall, Burston, Staffordshire, ST18 0DR

Grid Reference SJ 936 300

Method

To obtain flood flow estimations for the Jolpool Brook at Burston Hall, it is proposed to use the revised FEH statistical method, developed by CEH Wallingford in 2007. QMED shall be obtained from catchment characteristics, as there is no gauge at the site, and improved using the QMED from a local donor site using the new CEH Wallingford 2007 revised data transfer calculation. A suitable pooling group shall be used and a GL distribution applied to produce flood frequency estimates.

These estimates will then be compared against the Revitalised FSR/FEH Rainfall Runoff method and the IH124 method.

Catchment Descriptors

From FEH CD-ROM, catchment descriptors for the site are:

AREA	4.58km^2	PROPWET	0.44
FARL	1.000	BFIHOST	0.545
URBEXT$_{2000}$	0.0068	DPLBAR	3.14km
SAAR	775mm	DPSBAR	62.0m/km
SPRHOST	32.9		

QMED for the site from Catchment Descriptors

$$QMED = 8.3062 \times AREA^{0.8510} \times 0.1536^{\frac{1000}{SAAR}} \times FARL^{3.4451} \times 0.0460^{BFIHOST^2}$$

$$QMED = 8.3062 \times 4.58^{0.8510} \times 0.1536^{\frac{1000}{775}} \times 1.000^{3.4451} \times 0.0460^{0.545^2}$$

$$QMED = 8.3062 \times 3.6509 \times 0.0892 \times 1.000 \times 0.4007$$

$$QMED = 1.08 m^3/s$$

No urban adjustment needed as URBEXT$_{2000}$ = 0.0068

Data Transfer

Gauging station for data transfer to adjust the QMED at the site.

			28008
AREA	397.97km^2	SAAR	1022mm
FARL	0.991	SPRHOST	24.77
URBEXT$_{2000}$	0.659	BFIHOST	0.555
QMED from AMAX 1954-2005	86.965		

Using the new revised data transfer method produced by CEH Wallingford in 2007, gauge 28008 has been chosen as the single donor to improve QMED at the site. The gauge is approximately 29.04km from the site.

Dove at Rocester Weir, 28008

QMED from catchment descriptors

$$QMED = 8.3062 \times AREA^{0.8510} \times 0.1536^{\frac{1000}{SAAR}} \times FARL^{3.4451} \times 0.0460^{BFIHOST^2}$$

$$QMED = 8.3062 \times 397.97^{0.8510} \times 0.1536^{\frac{1000}{1022}} \times 0.991^{3.4451} \times 0.0460^{0.555^2}$$

$$QMED = 8.3062 \times 163.1070 \times 0.1599 \times 0.9693 \times 0.38734$$

$$QMED = 81.34 m^3 / s$$

A weighted average of the estimates of QMED is applied based on the FEH comments on gauge suitability.

Revised adjustment QMED for Burston Hall

$$QMED_{s,adj} = QMED_{s,cds} \left(\frac{QMED_{g,obs}}{QMED_{g,cds}} \right)^a$$

$$QMED_{s,adj} = 1.08 \times \left(\frac{86.965}{81.34} \right)^a$$

$$a = 0.4598 \times \exp(-0.020 \times dij) + (1 - 0.4598) \times \exp(-0.4785 \times dij)$$

$$a = 0.4598 \times \exp(-0.020 \times 29.04) + (1 - 0.4598) \times \exp(-0.4785 \times 29.04)$$

$$a = 0.4598 \times 0.5595 + 0.5402 \times 0.000000922$$

$$a = 0.26$$

$$QMED_{s,adj} = 1.08 \times \left(\frac{86.965}{81.34} \right)^{0.26}$$

$$QMED_{s,adj} = 1.1 m^3 / s$$

FEH Pooled Analysis

FEH pooling group for Burston Hall SJ 936 300 using stations ok for pooling from updated WINFAP data supplied from UK HiFlows website.

Pooling Group	
25019	45817
44801	20006
(32029)	206004
33045	203046
20002	41022
45816	30004
29009	20007
53017	49004
54034	36009
	50009

Giving a total of 520 years of records, however station 32029 only has five years of records and has therefore been removed from the pooling group and replaced with 50009.

This new pooling group is considered strongly heterogeneous and a review of the pooling group is desirable.

After analysing the pooling group, it appears that gauges 206004, 50009 and 36009 are discordant. They all appear to have very low values for L-skewness and L-kurtosis. Therefore, these stations have been removed from the data and replaced with stations 51003 and 36003.

Pooling Group	
44801	20006
33045	203046
20002	41022
45816	30004
25019	20007
29009	49004
53017	51003
54034	36003
45817	

Giving a total of 526 years of records and the pooling group is now considered as possibly heterogeneous.

The pooling group has been used to calculate the final flow estimates.

Return Period	Peak Flow (m^3/s)
2	1.1
5	1.6
10	2.0
25	2.5
50	3.0
100	3.5
200	4.1
500	4.9

Revitalised FSR/FEH Rainfall Runoff Method (ReFH)

The ReFH spreadsheet has been used to calculate flows on the Jolpool Brook.

Return Period	Peak Flow (m^3/s)
2	1.5
5	2.0
10	2.4
25	2.9
50	3.4
100	4.0
150	4.4

IH124 Method

$$QBAR = 0.00108 \times AREA^{0.89} \times SAAR^{1.17} \times SOIL^{2.17}$$

AREA = 4.58*

SAAR4170 = 784*

* Values taken from the FEH CD-ROM

SOIL= Soil type from FSR WRAP maps

SOIL = 0.45

$$QBAR = 0.00108 \times 4.58^{0.89} \times 784^{1.17} \times 0.45^{2.17}$$

$$QBAR = 0.00108 \times 43.87409 \times 2434.163766 \times 0.17679$$

$$QBAR = 1.8$$

To calculate the final flows the IH124/FSR growth factors for the Midlands was applied to QBAR.

Return Period		Peak Flow (m^3/s)
2	0.89 x 1.8	1.6
5	1.23 x 1.8	2.2
10	1.49 x 1.8	2.7
25	1.87 x 1.8	3.4
50	2.20 x 1.8	4.0
100	2.57 x 1.8	4.6
200	2.98 x 1.8	5.4

Conclusion

After calculating the flows using the three different methods, the ReFH flows will be used to estimate flood flows on the Jolpool Brook. The Revised FEH Statistical method is the most appropriate for the size of the catchment. The ReFH method will be used as it is more conservative than the revised statistical method. The IH124 method is a simple three parameter equation used to indicate that the flows are of an appropriate magnitude.

Final flow estimates – ReFH Method

Return Period	Peak Flow (m^3/s)
2	1.5
5	2.0

Our Ref: MC16915/DE

Your Ref:

Date: 07 April 2009

Dear Mr G Wilson

RE: BURSTON HALL, BURSTON, STAFFORDSHIRE ST18 ODR

Thank you for your enquiry requesting information relating to the above site.

Flood Risk
Our records indicate that the property lies on the **edge of Flood Zone 3** (1% annual probability or 1 in 100 year flood) **but within Flood Zone 2** (0.1% annual probability or 1 in 1000 year flood) of the River Trent. Please find enclosed a copy of the Flood Map for the area in the vicinity of the property.

Modelled levels taken from our March 2009 River Trent flood mapping study. Please see enclosed flood map for node locations:

	Return Period (Yrs)							
	mAOD	mAOD	mAOD	mAOD	mAOD	mAOD	mAOD	mAOD
NodePoint	5	10	25	50	75	100	150	200
3161413844	80.68	80.8	80.98	81.11	81.19	81.26	81.36	81.44
3161413485	80.54	80.67	80.85	81	81.09	81.16	81.26	81.34
3161413129	80.42	80.56	80.75	80.9	80.99	81.06	81.17	81.25
3161412768	80.26	80.41	80.61	80.76	80.86	80.93	81.04	81.12

Defences/Crest levels
There are currently no Environment Agency maintained flood defences at the site address/location.

Historic Flooding
Following an examination of our records of Historic Flooding (see explanation below) we have no record of flooding in the area. However this does not mean that the area of the property / site has never flooded. At the present time we do not have records of flooding in this area.

You are advised to contact your local authority or internal drainage board, to see if they have other relevant local flood information.

What are our records of Historic Flooding?
Our records of Historic Flooding show the extents of known flooding from rivers, the sea, and groundwater. The data does not show all the flooding that may ever have occurred – we can only show flooding where we have adequate records. If an area of land shown outside the extents of our recorded flooding area this does not mean it has never flooded. When more data on historic flooding becomes available, and as flood incidents occur, we will record this and update our historic data where appropriate.

Flood Warnings Direct
The nearest location for the Environment Agency's flood warnings direct service lies to the South East of the proposed location.

Notice for the supply of Environment Agency information
(Standard Notice – Commercial)

1. Nothing in this notice will in any way restrict your statutory or any other rights of access to the Information. If you wish to do anything in excess of those rights you may do so in accordance with the following paragraphs only if you agree to all the terms.
2. All intellectual property rights in the documents, data or information supplied to you (referred to as "the Information") whether owned by the Environment Agency (referred to as "Agency information") or third parties (referred to as "Third Party information") will continue to be owned by them.
3. The information has not been prepared to meet your or anyone else's individual requirements. It is your responsibility to ensure that the Information meets your needs.
4. The Environment Agency cannot ensure and therefore gives no promise that the Information in its possession will always be accurate, complete, up to date or valid.
5. The Environment Agency will take reasonable precautions to ensure that we provide you with an accurate copy of the Information from our records.
6. If we have specified that you must pay us for supply of the Information you must pay us before we respond to your request. You will only be able to cancel and request your fee back up to the point when we start work on providing the requested information.
7. If you have asked for the Information to be supplied in an electronic format we cannot guarantee that either the disk or the data file is free of any defects and you should check it for viruses and other items that may affect your computer.
8. Use of Third Party information, including copying, must be limited to statutory rights. This generally means that you will need to seek permission to copy. Third Party information may include information from our public registers, which has been supplied to us by a third party, for example the Information provided in an application form.

Permitted use of Agency information

9. As you have paid us our internal commercial usage charge (currently £10) you may take unlimited copies of Agency information (exactly as it is) for the internal purposes of your business (commercial internal limited use), provided that:
   a) you ensure that all copies are attributed to the Environment Agency;
   b) you do not amend or alter the Information, or merge it with other information;
   c) you do not supply the Information (or any information derived from, or based on the use of it) to others.
10. If you are a professional advisor and you have paid us our internal commercial usage charge (currently £10) you may in addition to the rights in paragraph 9, give copies of Agency information (exactly as it is) to your client and any other person who reasonably requires a copy (limited professional use), provided that:
    a) any copies you send are in connection with the specific transaction or matter for which you obtained the Information from the Environment Agency;
    b) you make no charge for supplying the Information other than for your actual costs and time incurred;
    c) you attach a copy of this notice and require all recipients to comply with it.

    Recipients of information under this paragraph do not need to pay any additional fee as long as they use the Information exactly as it is, internally and only for the same specific transaction or matter.
11. Please contact us if you need permission for any other use.

It is important that you also read any additional information or warning we give you about specific information.

Appendix H – Correspondence from British Waterways

Subject: Flood risk assessment Burston Hall ST18 0DR NGR 393656 330065

Dear Claire,

Your request for information was passed on to me for comment.

I am pleased to confirm the following:-

- I have examined British Waterways archives which contain records of breaches and overtopping incidents.
- There are no records of any incidences of breaching or overtopping along this section of the canal.

For further advice on flood risk assessments I have included some generic guidance (see appendix A).

If you require any further specific information or wish to view any relevant inspection reports you will be charged for our reasonable costs incurred in providing this information. Details of our hourly rates can be found in appendix 4 of British Waterways published Code of Practice for Works Affecting British Waterways available on the internet at:

http://www.britishwaterways.co.uk/images/Code_of_Practice_for_Works_Affecting_BW.pdf

The minimum charge for these additional works will be £60 plus VAT.

Please note that we are unable to comment on the flood risk to individual properties or developments and interpretation of the information provided in this communication is your responsibility.

Appendix A - Guidance Note for Flood Risk Assessments

The main incidents of uncontrolled loss of water from our waterways are overtopping and breaching as a result of inundation from adjacent water courses, vandalism or structural failure.

British Waterways maintains water levels using reservoirs, feeders and boreholes, and thereafter manages the water by transferring it within the canal system. The level of the water in canals is normally determined predominantly by the level and size of weirs. Water levels in river navigations are affected by the flow in the river and will fluctuate more widely than canals.

When surface water enters our waterways, the level of the water rises. Eventually the water level will reach a point where it discharges from our waterways through control structures. Where the capacity of these control structures is exceeded, overtopping may result.

Breaches which may lead to flooding can occur on our waterways. There can be a number of causes for these including: culvert collapse, animal burrowing and overtopping. British Waterways operates a comprehensive asset management system which enables us to manage the risks of such events occurring.

Breaches occur on average at a rate of three per year over the whole of the British Waterways owned canal network (that s over 2,000 mile of canal).

I trust this is satisfactory, however if you do require any further information please do not hesitate to contact me.

Regards,

Tony.

Subject: RE: Jolpool Brook, Burston, Staffs

Follow Up Flag: Follow up
Flag Status: Completed

Claire,

Having spoken to our structures maintenance engineer and having trawled through our electronic records it seems we have no drawings for this culvert. In the liability records for the culvert it states that it is of a semi circular construction 8' wide by 4' deep but obviously we cannot guarantee the accuracy of this information.

Sorry I cannot be of more assistance.

Brian

This is the correct culvert, if you have any further information you could send to me that would be much appreciated.

Kind Regards

Claire,

Please find attached the examination report for a culvert I believe is the one you have requested further information for. If you can confirm that this is the correct structure I will endeavour to find the construction drawings for it.

However, there is no guarantee that we have the drawings for it but I will try my best.

NOTES

SURVEY CONTROL:

A) SURVEY GRID (HORIZONTAL):

THIS SURVEY IS ORIENTATED TO ORDNANCE SURVEY GRID NORTH. THE SURVEY IS REDUCED TO A PLANE GRID ABOUT BASE POINT STN/1. HORIZONTAL MEASUREMENTS TAKEN FROM THIS SURVEY WILL BE GROUND DISTANCES.

THE CONTROL HAS BEEN ESTABLISHED USING TRIMBLE VRS NOW NETWORK REAL TIME KINEMATIC (NRTK) FOR THE ON-SITE SURVEY CONTROL, USING TOPCON GPS SYSTEM, ANTENNA HIPER 2, MOUNTED ON A 2 METRE POLE STABILISED USING A BI-POD DURING OCCUPATIONS.

THE LOCAL SCALE FACTOR (LSF) APPLICABLE TO THIS SITE IS 0.99960178, CALCULATED USING STANDARD TABULATED DATA. THE SITE CENTRE CO-ORDINATES HAVE BEEN TAKEN AS BEING SURVEY STATION STN/1.

(FOR THIS RELATIVELY LOW LEVEL SITE, MEAN SEA LEVEL CORRECTIONS (MSL) ARE DEEMED TO BE INSIGNIFICANT AND HAVE THEREFORE NOT BEEN APPLIED.)

B) VERTICAL DATUM:

ALTITUDES FOR THE CONTROL ARE BASED GPS DERIVED HEIGHTS FOR SURVEY STATIONS STN/5 AND 6 AND CONVERTED TO ORTHOMETRIC HEIGHTS (ORDNANCE DATUM NEWLYN - ODN) USING OSGM02 TRANSFORMATION PARAMETERS AND ADJUSTED TO FIT ORTHOMETRIC LEVELLED HEIGHT DIFFERENCES TO OBTAIN FINAL ODN HEIGHT VALUES.

NO NEARBY OSBM WAS AVAILABLE TO CHECK.

C) GPS CONTROL:

THE CO-ORDINATE SYSTEM USED FOR THE PRIMARY CONTROL IS OSGB36; THIS HAS BEEN CALCULATED FROM ETRS89 USING OSTN02 TRANSFORMATION PARAMETERS.

OBSERVATIONS HAVE BEEN TAKEN ON THE FOLLOWING DATE: - 30/03/2015

2. THIS DRAWING IS TO BE READ IN CONJUNCTION WITH ALL OTHER RELEVANT DRAWINGS/DOCUMENTATION.
3. IF IN DOUBT ASK.
4. CRITICAL DIMENSIONS AND HEIGHTS MUST BE CHECKED ON SITE PRIOR TO CONSTRUCTION.

TREE SCHEDULE

No.	DIA.	SPREAD Ø	HEIGHT
TE/1	0.3	6	10
TE/2	0.15	6	8
TE/3	0.4	8	10
TE/4	0.4	6	6
TE/5	0.2	4	8
TE/6	0.3	10	10
TE/7	0.3	6	6
TE/8	0.15	4	5
TE/9	0.3	8	7
TE/10	0.4	8	7
TE/11	0.5	8	13
TE/12	0.3	8	7

TREE NOTES.

1) MB - MULTI BOLE.
2) TB - TWIN BOLE.
3) DIA. - APPROXIMATE DIAMETER MEASURED AT 1.5M ABOVE GROUND LEVEL.
   a. TRUNK SHOWN NOT TO SCALE - SEE SCHEDULE ABOVE FOR ACTUAL SIZE.
4) SPREAD - DIAMETER OF CANOPY.
   a. TREE SPREADS ARE SYMBOLIC ONLY AND ARE REPRESENTATIVE OF THE AVERAGE SPREAD. THIS MAY NOT REPRESENT THE TRUE OUTLINE.
   b. NOTE THAT THE TREE BOLE MAY NOT SIT CENTRALLY TO CANOPY.
5) HEIGHT - APPROXIMATE HEIGHT TO TOP OF CANOPY ESTIMATED FROM GROUND LEVEL.
6) THE TREE TYPES HAVE NOT BEEN IDENTIFIED BY AN ARBORIST AND HAVE THEREFORE BEEN ASSIGNED THE GENERAL FAMILY OR COLLOQUIAL TREE NAMES RATHER THAN THEIR FULL INDIVIDUAL SCIENTIFIC NAMES. SPECIALIST TREE SURVEYS CAN BE ARRANGED UPON REQUEST.
7) ATTENTION SHOULD BE PAID TO THE ORIGINAL TOPOGRAPHICAL SURVEY BRIEF AS TO WHAT TREES HAVE ACTUALLY BEEN SCHEDULED; I.E. ONLY THOSE "TREES LARGER THAN DIAMETER "X" OR "ONLY TREES WITHIN THE IMMEDIATE SURVEY LIMITS". (THIS IS NORMALLY THE CASE UNLESS OTHERWISE SPECIFIED AS INCLUDING "OFF SITE" TREES).

GENERAL

NO ALLOWANCE HAS BEEN MADE FOR SUB SURFACE ENTRY INTO MANHOLES OR OTHER CHAMBERS OR VOIDS BELOW GROUND LEVEL. THEREFORE ANY DETAILS RELATING TO DEPTHS, SIZES ETC. ARE TAKEN FROM ABOVE GROUND AND AS SUCH WILL BE APPROXIMATE ONLY.

THE CONTRACTOR IS TO CHECK AND VERIFY ALL CRITICAL DIMENSIONS AND LEVELS BEFORE WORK STARTS.

BURIED SERVICES SHOWN ON THIS DRAWING MAY BE ASSUMED ROUTES AND WILL NORMALLY BE OF UNKNOWN CONDITION, CONTRACTORS SHOULD UNDERTAKE SUITABLE VALIDATION WORK AND TAKE PARTICULAR CARE DURING EXCAVATION WORK; SAFE DIGGING PRACTICES SHOULD BE FOLLOWED.

SHOULD THERE BE ANY CONFLICT BETWEEN THE DETAILS INDICATED ON THIS DRAWING AND THOSE INDICATED ON OTHER DRAWINGS, THEN TOWER SURVEYS SHOULD BE INFORMED PRIOR TO CONSTRUCTION ON SITE.

IT IS IMPORTANT TO NOTE THAT THE SAME ACCURACIES IMPLIED BY THE PLOTTING SCALE ARE EQUALLY APPLICABLE TO DIGITAL DATA SUPPLIED FOR CAD.

EVERY EFFORT IS MADE TO IDENTIFY ALL VISIBLE ABOVE GROUND FEATURES. HOWEVER, IT SHOULD BE BORNE IN MIND THAT THERE MAY BE ITEMS OBSCURED AT THE TIME OF SURVEY.

VISIBLE FEATURES IN THE VICINITY OF THE BOUNDARIES, AS SHOWN ON THIS SURVEY, MAY NOT REPRESENT THE EXTENT OF LEGALLY CONVEYED OWNERSHIP.

GENERAL

NO ALLOWANCE HAS BEEN MADE FOR SUB SURFACE ENTRY INTO MANHOLES OR OTHER CHAMBERS OR VOIDS BELOW GROUND LEVEL. THEREFORE ANY DETAILS RELATING TO DEPTHS, SIZES ETC. ARE TAKEN FROM ABOVE GROUND AND AS SUCH WILL BE APPROXIMATE ONLY.

THE CONTRACTOR IS TO CHECK AND VERIFY ALL CRITICAL DIMENSIONS AND LEVELS BEFORE WORK STARTS.

BURIED SERVICES SHOWN ON THIS DRAWING MAY BE ASSUMED ROUTES AND WILL NORMALLY BE OF UNKNOWN CONDITION. CONTRACTORS SHOULD UNDERTAKE SUITABLE VALIDATION WORK AND TAKE PARTICULAR CARE DURING EXCAVATION WORK; SAFE DIGGING PRACTICES SHOULD BE FOLLOWED.

SHOULD THERE BE ANY CONFLICT BETWEEN THE DETAILS INDICATED ON THIS DRAWING AND THOSE INDICATED ON OTHER DRAWINGS, THEN TOWER SURVEYS SHOULD BE INFORMED PRIOR TO CONSTRUCTION ON SITE.

IT IS IMPORTANT TO NOTE THAT THE SAME ACCURACIES IMPLIED BY THE PLOTTING SCALE ARE EQUALLY APPLICABLE TO DIGITAL DATA SUPPLIED FOR CAD.

EVERY EFFORT IS MADE TO IDENTIFY ALL VISIBLE ABOVE GROUND FEATURES. HOWEVER, IT SHOULD BE BORNE IN MIND THAT THERE MAY BE ITEMS OBSCURED AT THE TIME OF SURVEY.

VISIBLE FEATURES IN THE VICINITY OF THE BOUNDARIES, AS SHOWN ON THIS SURVEY, MAY NOT REPRESENT THE EXTENT OF LEGALLY CONVEYED OWNERSHIP.

1.0 Introduction

1.1 Background

RAB Consultants has prepared this preliminary hydraulic assessment to make a high level assessment of flood risk at two sites which have been put forward to be included within the Burston and Sandon Neighbourhood Plan.

1.2 Site location

The proposed sites are located to the south of the A51, in the village of Burston, Staffordshire (Figure 1). They are situated close to the Jolpool Brook and are located within Flood Zone 3 on the Environment Agency's indicative flood map.

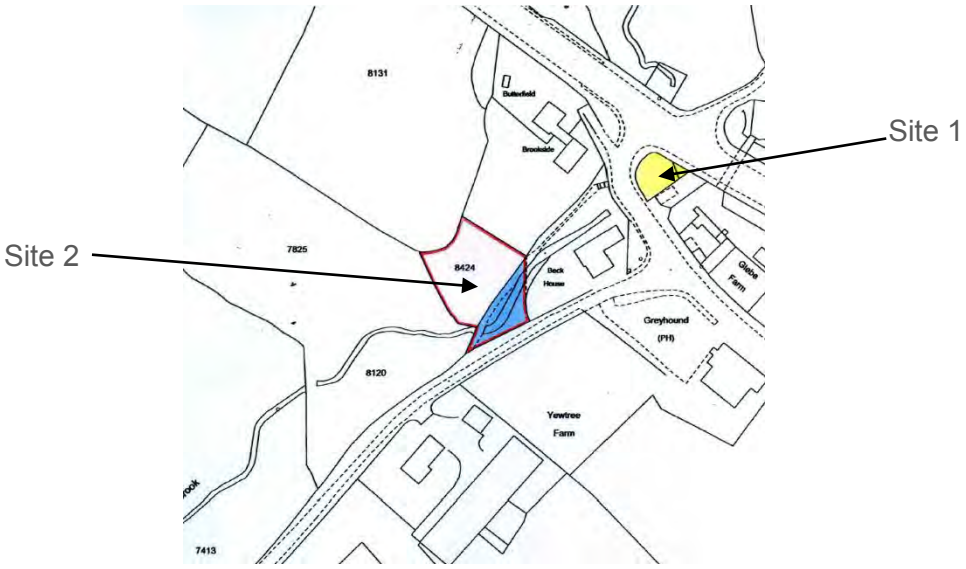

FIGURE 1: SITE LOCATIONS, HIGHLIGHTED IN YELLOW AND RED

The Environment Agency does not hold modelled flood risk information for the Jolpool Brook, therefore simple hydrological and hydraulic calculations will be undertaken for this preliminary assessment of flood risk at the two sites.

2.0 Jolpool Brook Flow Calculations

2.1 Method

To obtain flood flow estimations for the Jolpool Brook at Burston, it is proposed to limit hydrology estimations to the Revitalised FSR/FEH rainfall runoff method, given the preliminary nature of this work. This was done using the WHS ReFH2 software package.

2.2 Catchment descriptors

Catchment descriptors were obtained from the FEH CD-ROM 3. The map of the catchment is provided below (Figure 2).

FIGURE 2: CATCHMENT OF THE JOLPOOL BROOK

The catchment descriptors for the site are:

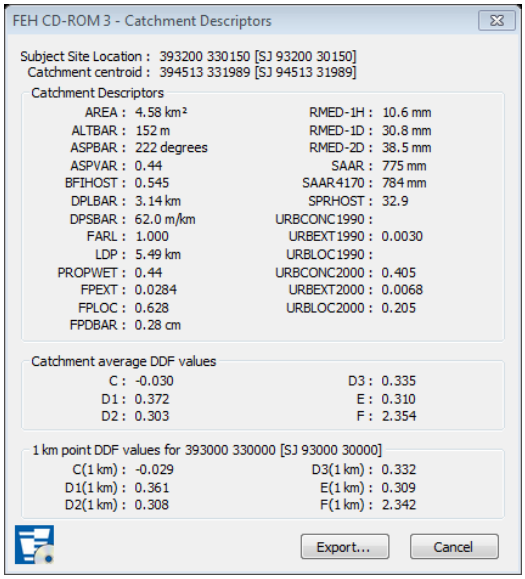

FIGURE 3: CATCHMENT CHARACTERISTICS OF THE JOLPOOL BROOK CATCHMENT

2.3 ReFH flow results

The ReFH 2 spreadsheet has been used to calculate flows on the Jolpool Brook (Appendix A).

Return period	Peak flow (m^3/s)
20 year	2.24
100 year	3.30
100 year plus climate change	3.96

3.0 Hydraulic model

3.1 Hec-Ras model

A short steady state Hec-Ras model of the Jolpool Brook has been constructed to assess the flood risk at the two sites proposed to be included within the Burston and Sandon Neighbourhood Plan.

A topographic survey produced by Tower Surveys in May 2012, includes cross sections along the Jolpool Brook, starting to the north of the A51 and extending downstream of the two sites to the railway bridge. In order to gain a better understanding of the flood risk at the two sites, cross sections have been input into Hec-Ras down to cross section 1:104 (refer to Appendix B), just south of the second site.

A number of assumptions have been made within the model, these are described in the next section.

3.2 Assumptions within the model

The following assumptions have been made within the Hec-Ras model:

- Cross section 7 has been added upstream of the model, by copying the adjacent cross section and adjusting the elevation by extrapolation, as the topographic survey doesn't extend that far upstream
- Cross section 5.33 has been added by the interpolation function within the model, as the surveyors were unable to gain access to the downstream end of the culvert
- The high chords of the bridge have been estimated using the road levels of the A51(upstream) and Burston Road (downstream) as this information is unavailable on the topographic survey
- The invert level of the culvert has been estimated downstream
- The entrance loss coefficient has been assumed in the absence of any culvert shape details
- It is assumed that no manholes along the A51 feed into the culvert
- It is assumed that the footbridge adjacent to cross section 3 will have negligible impact on flood flows and on the overall flood risk at Site 2, therefore it has not been included in the hydraulic model.

3.3 Results

The ReFH estimated flows have been used to model water surface elevations at each cross section on the Jolpool Brook. The table below provides a summary of these water surface elevations

Predicted flood levels for the Jolpool Brook			
Model section	Annual probability (%)		
	5	1	1+cc
7	91.70	92.35	92.85
6	91.66	92.35	92.85
5.333	90.66	90.80	90.89
5	90.32	90.43	90.48
4	89.99	90.29	90.33
3	89.87	89.97	90.00
2	89.86	90.00	90.08
1	89.40	89.52	89.59

3.3.1. Site 1

The Jolpool Brook flows through a culvert past Site 1 and resurfaces approximately 15m downstream of the site. Therefore, the most relevant cross section to the site is cross section 6, which is approximately 30m upstream of the Site 1.

Ground levels at the site range between 91.75m AOD and 92.51m AOD. However, the A51 acts as a barrier preventing floodwater from reaching Site 1. Ground levels along the A51 range between 93.97m AOD and 94.84m AOD, over 1m higher than the 1% plus climate change flood level for the Jolpool Brook. It is more likely that the flood water upstream of the culvert will be contained by the A51 and will fill up the floodplain upstream rather than the road being overtopped by flood water from the Jolpool Brook. Therefore it is expected that Site 1 will remain dry during the most extreme flood events.

There is a residual risk of flooding due to a blockage of the culvert upstream of the site. The model output for a 50% blockage of the culvert indicates that the modelled water levels will overtop the A51 during the 1% and 1% plus climate change annual probability flood events. It is expected that the road will begin to overtop during the 3.33% annual probability flood event during a blockage scenario.

Residual risk, 50% blockage of culvert			
Model section	Annual probability (%)		
	5	1	1+cc
7	93.50	94.11	94.15
6	93.50	94.11	94.15

The site is at residual risk of flooding, however this does not mean the site is undevelopable. More detail is needed to determine the residual risk of flooding at the site and to enable recommendations for mitigation measures.

3.3.2. Site 2

The Jolpool Brook is located along the southern boundary of Site 2. Figure 4 below, demonstrates the predicted extent of each flood event at Site 2 (Appendix D).

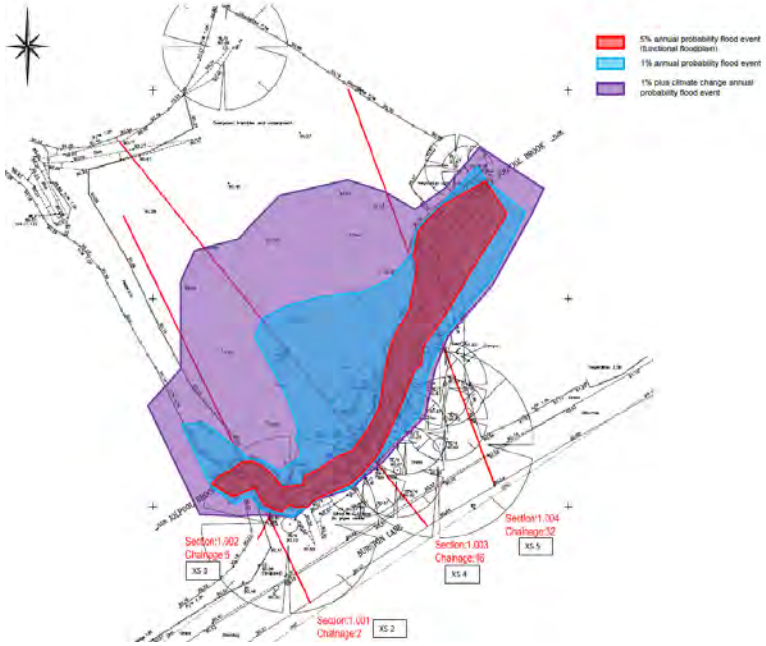

FIGURE 4: THE PREDICTED FLOOD EXTENT AT SITE 2, SEE APPENDIX D

The site is expected to flood during the 1% and 1% plus climate change flood event, whilst the 5% annual probability is expected to remain within the channel of the brook, along the majority of its course (Appendix D). The 5% annual probability flood event may come out of bank around a small section at cross section 5, however it is expected to re-enter the brook just downstream and remain in channel during the remainder of its flow through Site 2.

Paragraph 103 of National Planning Policy Framework states that 'within the site, the most vulnerable development is located in areas of lowest flood risk unless there are overriding reasons to prefer a different location. Therefore a sequential approach will need to be taken when locating development on Site 2.

The white area is the most appropriate area for development on the site, as no flood risk mitigation would be required (assuming that access is available outside the shaded area). More vulnerable developments such as residential dwellings would be suitable within this area.

Within the 1% (blue area) and 1% plus climate change (purple area) annual probability flood extents the most appropriate developments would be less vulnerable developments such as commercial buildings, amenity space or garden areas. However, by exception, if there is an overriding reason which deems that a more vulnerable development is required in this area, compensatory ground excavation will be needed to mitigate the loss of floodplain. Consideration will also need to be given to safe access routes in this area.

Finally, the 5% (red area) annual probability flood extent, indicates where development is inappropriate. No development should be permitted within this area.

The Environment Agency normally requires easement from the top of the river bank for emergency access and essential maintenance. Any proposed development at Site 2 will need to be located at least 8m away from the top of the bank of the Jolpool Brook.

The 50% blockage scenario is not expected to increase the flood levels expected at Site 2.

4.0 Conclusions

A high level assessment has been taken to assess the flood risk at two sites in Burston, Staffordshire, along the course of the Jolpool Brook. According to the Environment Agency's indicative flood map the sites are both located within Flood Zone 3.

The Environment Agency was unable to provide any modelled flood levels for the Jolpool Brook, therefore a simple Hec-Ras model has been created to assess the flood risk to both sites. As a preliminary approach has been taken to estimate the flood levels, a number of assumptions have been made within the model and a comparison with only the ReFH2 methodology for the hydrology has been undertaken.

The results indicate that due to the height of the A51, Site 1 is not likely to be affected by flooding during any flood event used within this assessment. However, a residual risk of blockage may cause some flooding to Site 1. Whereas, Site 2 will be affected by the 1% and 1% plus climate change annual probability flood events.

5.0 Recommendations

The following actions are recommended:

- If the two sites are to be developed, the following actions will be necessary:
  - Extend topographic survey
  - Produce a detailed hydraulic model using the extended survey to address the assumptions made in this preliminary assessment

- Confirm the culvert location in relation to Site 1
- Preparation of a flood risk assessment report, with sequential and exception tests, in accordance with the National Planning Policy Framework, for each site.

UK Design Flood Estimation

Generated on Monday, June 22, 2015 10:37:28 AM by User
Printed from the ReFH Flood Modelling software package, version 2.0.5591.16293

Summary of estimate using the Flood Estimation Handbook revitalised flood hydrograph method (ReFH)

Site details Checksum: 0607-DAA8

Site name: Jolpool_Brook_Catchment_Descriptors

Easting: 393200

Northing: 330150

Country: England, Wales or Northern Ireland

Catchment Area (km²): 4.58

Using plotscale calculations: No

Site description: None

Model run: 100 year

Summary of results

FEH DDF Rainfall (mm):	62.48	Total runoff (ML):	52.44
Total Rainfall (mm):	41.93	Total flow (ML):	130.08
Peak Rainfall (mm):	11.40	Peak flow (m³/s):	3.30

Parameters

** Where the user has overriden a system-generated value, this original value is shown in square brackets after the value used.*

Rainfall parameters

Name	Value	User-defined?
Duration (hr)	4.5	No
Timestep (hr)	0.5	No
SCF(Seasonal correction factor)	0.7	No
ARF(Areal reduction factor)	0.96	No
Seasonality	Winter	n/a

Loss model parameters

Name	Value	User-defined?
Cini (mm)	111.3	No
Cmax (mm)	434.83	No
Use alpha correction factor	Yes	No
Alpha correction factor	0.87	No

Routing model parameters

Name	Value	User-defined?
Tp (hr)	2.54	No
Up	0.65	No
Uk	0.8	No

Baseflow model parameters

Name	Value	User-defined?
BF0 (m^3/s)	0.17	No
BL (hr)	40.12	No
BR	1.5	No

Urbanisation parameters

Name	Value	User-defined?
Urban area (km^2)	0.05	No
Urbext 2000	0.01	No
Urban runoff factor	0.7	No
Imperviousness factor	0.3	No
Tp scaling factor	0.5	No
Sewered area (km^2)	0.00	Yes
Sewer capacity (m^3/s)	0.00	Yes

1. DATUM DETAILS
   SURVEY CONTROL:

   A) SURVEY GRID (HORIZONTAL):
   THIS SURVEY IS ORIENTATED TO ORDNANCE SURVEY GRID NORTH. THE SURVEY IS TO A PLANE GRID. HORIZONTAL MEASUREMENTS TAKEN FROM THIS SURVEY WILL BE GROUND DISTANCES.
   ORDNANCE SURVEY NATIONAL GRID HAS BEEN ESTABLISHED USING TRIMBLE VRS NOW NETWORK REAL TIME KINEMATIC (NRTK), USING TRIMBLE GPS SYSTEM FIRMWARE V4.12, ANTENNA R8-2 SERIAL NUMBER 4732136934, MOUNTED ON A 2 METRE POLE STABILISED USING A BI-POD DURING OCCUPATIONS.
   THE LOCAL SCALE FACTOR (LSF) APPLICABLE TO THIS SITE IS 0.99960172, CALCULATED USING STANDARD TABULATED DATA. THE SITE CENTRE CO-ORDINATES HAVE BEEN TAKEN AS BEING STN/1.
   (FOR THIS RELATIVELY LOW LEVL SITE, MEAN SEA LEVEL CORRECTIONS (MSL) ARE DEEMED TO BE INSIGNIFICANT AND HAVE THEREFORE NOT BEEN SUPPLIED)

   B) VERTICAL DATUM:
   ALTITUDES FOR THE CONTROL ARE BASED ON GPS DERIVED HEIGHTS FOR STATIONS STN/1 AND STN/2 AND CONVERTED TO ORTHOMETRIC HEIGHTS (ORDNANCE DATUM NEWYLN - ODN) USING OSGM02 TRANSFORMATION PARAMETERS AND ADJUSTED TO FIT ORTHOMETRIC LEVELLED HEIGHTS TO OBTAIN FINAL ODN HEIGHT VALUES.
   A CHECK TO A LOCAL OSBM LOCATED ON ST VINCENT COTTAGE HAS BEEN MADE AND A DISCREPENCY OF 57mm NOTED.

   C) GPS CONTROL:
   THE CO-ORDINATE SYSTEM USED FOR THE PRIMARY CONTROL IS OSGB36; THIS HAS BEEN CALCULATED FROM ETRS89 USING OSTN02 TRANSFORMATION PARAMETERS.

   OBSERVATIONS HAVE BEEN TAKEN ON THE FOLLOWING DATE: - 04/01/2012

2. THIS DRAWING IS TO BE READ IN CONJUNCTION WITH
   ALL OTHER RELEVANT DRAWINGS/DOCUMENTATION. NAMELY: R-S2265/202 - SECTIONS
3. CHECK SCALE BEFORE TAKING NON-FIGURED DIMENSIONS FROM THIS DRAWING.
4. IF IN DOUBT ASK.
5. CRITICAL DIMENSIONS AND HEIGHTS MUST BE CHECKED ON SITE
   PRIOR TO CONSTRUCTION.
6. OS COPYRIGHT

GENERAL

NO ALLOWANCE HAS BEEN MADE FOR SUB SURFACE ENTRY INTO MANHOLES OR OTHER CHAMBERS OR VOIDS BELOW GROUND LEVEL. THEREFORE ANY DETAILS RELATING TO DEPTHS, SIZES ETC. ARE TAKEN FROM ABOVE GROUND AND AS SUCH WILL BE APPROXIMATE ONLY.

THE CONTRACTOR IS TO CHECK AND VERIFY ALL CRITICAL DIMENSIONS AND LEVELS BEFORE WORK STARTS.

BURIED SERVICES SHOWN ON THIS DRAWING MAY BE ASSUMED ROUTES AND WILL NORMALLY BE OF UNKNOWN CONDITION, CONTRACTORS SHOULD UNDERTAKE SUITABLE VALIDATION WORK AND TAKE PARTICULAR CARE DURING EXCAVATION WORK; SAFE DIGGING PRACTICES SHOULD BE FOLLOWED.

SHOULD THERE BE ANY CONFLICT BETWEEN THE DETAILS INDICATED ON THIS DRAWING AND THOSE INDICATED ON OTHER DRAWINGS, THEN TOWER SURVEYS SHOULD BE INFORMED PRIOR TO CONSTRUCTION ON SITE.

IT IS IMPORTANT TO NOTE THAT THE SAME ACCURACIES IMPLIED BY THE PLOTTING SCALE ARE EQUALLY APPLICABLE TO DIGITAL DATA SUPPLIED FOR CAD.

EVERY EFFORT IS MADE TO IDENTIFY ALL VISIBLE ABOVE GROUND FEATURES. HOWEVER, IT SHOULD BE BORNE IN MIND THAT THERE MAY BE ITEMS OBSCURED AT THE TIME OF SURVEY.

VISIBLE FEATURES IN THE VICINITY OF THE BOUNDARIES, AS SHOWN ON THIS SURVEY, MAY NOT REPRESENT THE EXTENT OF LEGALLY CONVEYED OWNERSHIP.

TREE SCHEDULE

No.	DIA. Ø	SPREAD Ø	HEIGHT
TE/1	0.3	8	14
TE/2	0.15	6	12
TE/3	0.3	8	14
TE/4	1.3	8	14
TE/5	0.5	12	14

TREE NOTES:

A) MB "X" NO – MULTIPLE BOLES FOLLOWED BY NUMBER OF.
B) DIA - (GIRTH) DIAMETER MEASURED AT APPROXIMATELY 1.5M ABOVE GROUND LEVEL.
C) SPREAD – DIAMETER OF CANOPY. (TREE SPREADS ARE INDICATIVE ONLY AND ARE REPRESENTATIVE OF THE GENERALISED CANOPY SIZE, AND MAY NOT REPRESENT THE TRUE CANOPY POSITION AS OUTLINED ON SITE – TREE BOLES MAY NOT SIT CENTRALLY TO THE CANOPY.)
D) HEIGHT – APPROXIMATE HEIGHT TO TOP OF CANOPY – ESTIMATED FROM GROUND LEVEL.
E) ATTENTION SHOULD BE PAID TO THE ORIGINAL TOPOGRAPHICAL BRIEF AS TO WHAT TREES HAVE ACTUALLY BEEN SCHEDULED I.E. THOSE TREES LARGER THAN DIAMETER "X" OR "ONLY TREES WITHIN THE IMMEDIATE SURVEY LIMITS", (THIS IS NORMALLY THE CASE UNLESS OTHERWISE SPECIFIED AS INCLUDING "OFF SITE" TREES).

NOTES

1. DATUM DETAILS

SURVEY CONTROL:

A) SURVEY GRID (HORIZONTAL):

THIS SURVEY IS ORIENTATED TO ORDNANCE SURVEY GRID NORTH. THE SURVEY IS TO A PLANE GRID. HORIZONTAL MEASUREMENTS TAKEN FROM THIS SURVEY WILL BE GROUND DISTANCES.

ORDNANCE SURVEY NATIONAL GRID HAS BEEN ESTABLISHED USING TRIMBLE VRS NOW NETWORK REAL TIME KINEMATIC (NRTK), USING TRIMBLE GPS SYSTEM FIRMWARE V4.12, ANTENNA R8-2 SERIAL NUMBER 4732139934, MOUNTED ON A 2 METRE POLE STABILISED USING A BI-POD DURING OCCUPATIONS.

THE LOCAL SCALE FACTOR (LSF) APPLICABLE TO THIS SITE IS 0.99960173, CALCULATED USING STANDARD TABULATED DATA. THE SITE CENTRE CO-ORDINATES HAVE BEEN TAKEN AS BEING STATION STN/2.

(FOR THIS RELATIVELY LOW LEVEL SITE, MEAN SEA LEVEL CORRECTIONS (MSL) ARE DEEMED TO BE INSIGNIFICANT AND HAVE THEREFORE NOT BEEN SUPPLIED)

B) VERTICAL DATUM:

ALTITUDES FOR THE CONTROL ARE BASED ON GPS DERIVED HEIGHTS FOR STATIONS STN/1 AND STN/2 AND CONVERTED TO ORTHOMETRIC HEIGHTS (ORDNANCE DATUM NEWLYN – ODN) USING OSGM02 TRANSFORMATION PARAMETERS AND ADJUSTED TO FIT ORTHOMETRIC LEVELLED HEIGHTS TO OBTAIN FINAL ODN HEIGHT VALUES.

C) GPS CONTROL:

THE CO-ORDINATE SYSTEM USED FOR THE PRIMARY CONTROL IS OSGB36; THIS HAS BEEN CALCULATED FROM ETRS89 USING OSTN02 TRANSFORMATION PARAMETERS.

OBSERVATIONS HAVE BEEN TAKEN ON THE FOLLOWING DATE: - 30/03/15

2. THIS DRAWING IS TO BE READ IN CONJUNCTION WITH
ALL OTHER RELEVANT DRAWINGS/DOCUMENTATION.
3. CHECK SCALE BEFORE TAKING NON-FIGURED DIMENSIONS FROM THIS DRAWING.
4. IF IN DOUBT ASK.
5. CRITICAL DIMENSIONS AND HEIGHTS MUST BE CHECKED ON SITE PRIOR TO CONSTRUCTION.

GENERAL

NO ALLOWANCE HAS BEEN MADE FOR SUB SURFACE ENTRY INTO MANHOLES OR OTHER CHAMBERS OR VOIDS BELOW GROUND LEVEL. THEREFORE ANY DETAILS RELATING TO DEPTHS, SIZES ETC. ARE TAKEN FROM ABOVE GROUND AND AS SUCH WILL BE APPROXIMATE ONLY.

THE CONTRACTOR IS TO CHECK AND VERIFY ALL CRITICAL DIMENSIONS AND LEVELS BEFORE WORK STARTS.

BURIED SERVICES SHOWN ON THIS DRAWING MAY BE ASSUMED ROUTES AND WILL NORMALLY BE OF UNKNOWN CONDITION, CONTRACTORS SHOULD UNDERTAKE SUITABLE VALIDATION WORK AND TAKE PARTICULAR CARE DURING EXCAVATION WORK; SAFE DIGGING PRACTICES SHOULD BE FOLLOWED.

SHOULD THERE BE ANY CONFLICT BETWEEN THE DETAILS INDICATED ON THIS DRAWING AND THOSE INDICATED ON OTHER DRAWINGS, THEN TOWER SURVEYS SHOULD BE INFORMED PRIOR TO CONSTRUCTION ON SITE.

IT IS IMPORTANT TO NOTE THAT THE SAME ACCURACIES IMPLIED BY THE PLOTTING SCALE ARE EQUALLY APPLICABLE TO DIGITAL DATA SUPPLIED FOR CAD.

EVERY EFFORT IS MADE TO IDENTIFY ALL VISIBLE ABOVE GROUND FEATURES. HOWEVER, IT SHOULD BE BORNE IN MIND THAT THERE MAY BE ITEMS OBSCURED AT THE TIME OF SURVEY.

VISIBLE FEATURES IN THE VICINITY OF THE BOUNDARIES, AS SHOWN ON THIS SURVEY, MAY NOT REPRESENT THE EXTENT OF LEGALLY CONVEYED OWNERSHIP.

1. DATUM DETAILS
SURVEY CONTROL:

A) SURVEY GRID (HORIZONTAL):
THIS SURVEY IS ORIENTATED TO ORDNANCE SURVEY GRID NORTH. THE SURVEY IS TO A PLANE GRID, HORIZONTAL MEASUREMENTS TAKEN FROM THIS SURVEY WILL BE GROUND DISTANCES.
ORDNANCE SURVEY NATIONAL GRID HAS BEEN ESTABLISHED USING TRIMBLE VRS NOW NETWORK REAL TIME KINEMATIC (WRTK), USING TRIMBLE GPS SYSTEM FIRMWARE V4.12, ANTENNA R8-2 SERIAL NUMBER 4732136934, MOUNTED ON A 2 METRE POLE STABILISED USING A BIPOD DURING OCCUPATIONS.
THE LOCAL SCALE FACTOR (LSF) APPLICABLE TO THIS SITE IS 0.99960172, CALCULATED USING STANDARD TABULATED DATA. THE SITE CENTRE CO-ORDINATES HAVE BEEN TAKEN AS BEING STN/1.
(FOR THIS RELATIVELY LOW LEVL SITE, MEAN SEA LEVEL CORRECTIONS (MSL) ARE DEEMED TO BE INSIGNIFICANT AND HAVE THEREFORE NOT BEEN SUPPLIED)

B) VERTICAL DATUM:
ALTITUDES FOR THE CONTROL ARE BASED ON GPS DERIVED HEIGHTS FOR STATIONS STN/1 AND STN/2 AND CONVERTED TO ORTHOMETRIC HEIGHTS (ORDNANCE DATUM NEWYLN - ODN) USING OSGM02 TRANSFORMATION PARAMETERS AND ADJUSTED TO FIT ORTHOMETRIC LEVELLED HEIGHTS TO OBTAIN FINAL ODN HEIGHT VALUES.
A CHECK TO A LOCAL OSBM LOCATED ON ST VINCENT COTTAGE HAS BEEN MADE AND A DISCREPENCY OF 57mm NOTED.

C) GPS CONTROL:
THE CO-ORDINATE SYSTEM USED FOR THE PRIMARY CONTROL IS OSGB36; THIS HAS BEEN CALCULATED FROM ETRS89 USING OSTN02 TRANSFORMATION PARAMETERS.

OBSERVATIONS HAVE BEEN TAKEN ON THE FOLLOWING DATE:- 04/01/2012

2. THIS DRAWING IS TO BE READ IN CONJUNCTION WITH
ALL OTHER RELEVANT DRAWINGS/DOCUMENTATION, NAMELY: R-S2265/202 - SECTIONS

3. CHECK SCALE BEFORE TAKING NON-FIGURED DIMENSIONS FROM THIS DRAWING.

4. IF IN DOUBT ASK.

5. CRITICAL DIMENSIONS AND HEIGHTS MUST BE CHECKED ON SITE PRIOR TO CONSTRUCTION.

6. OS COPYRIGHT

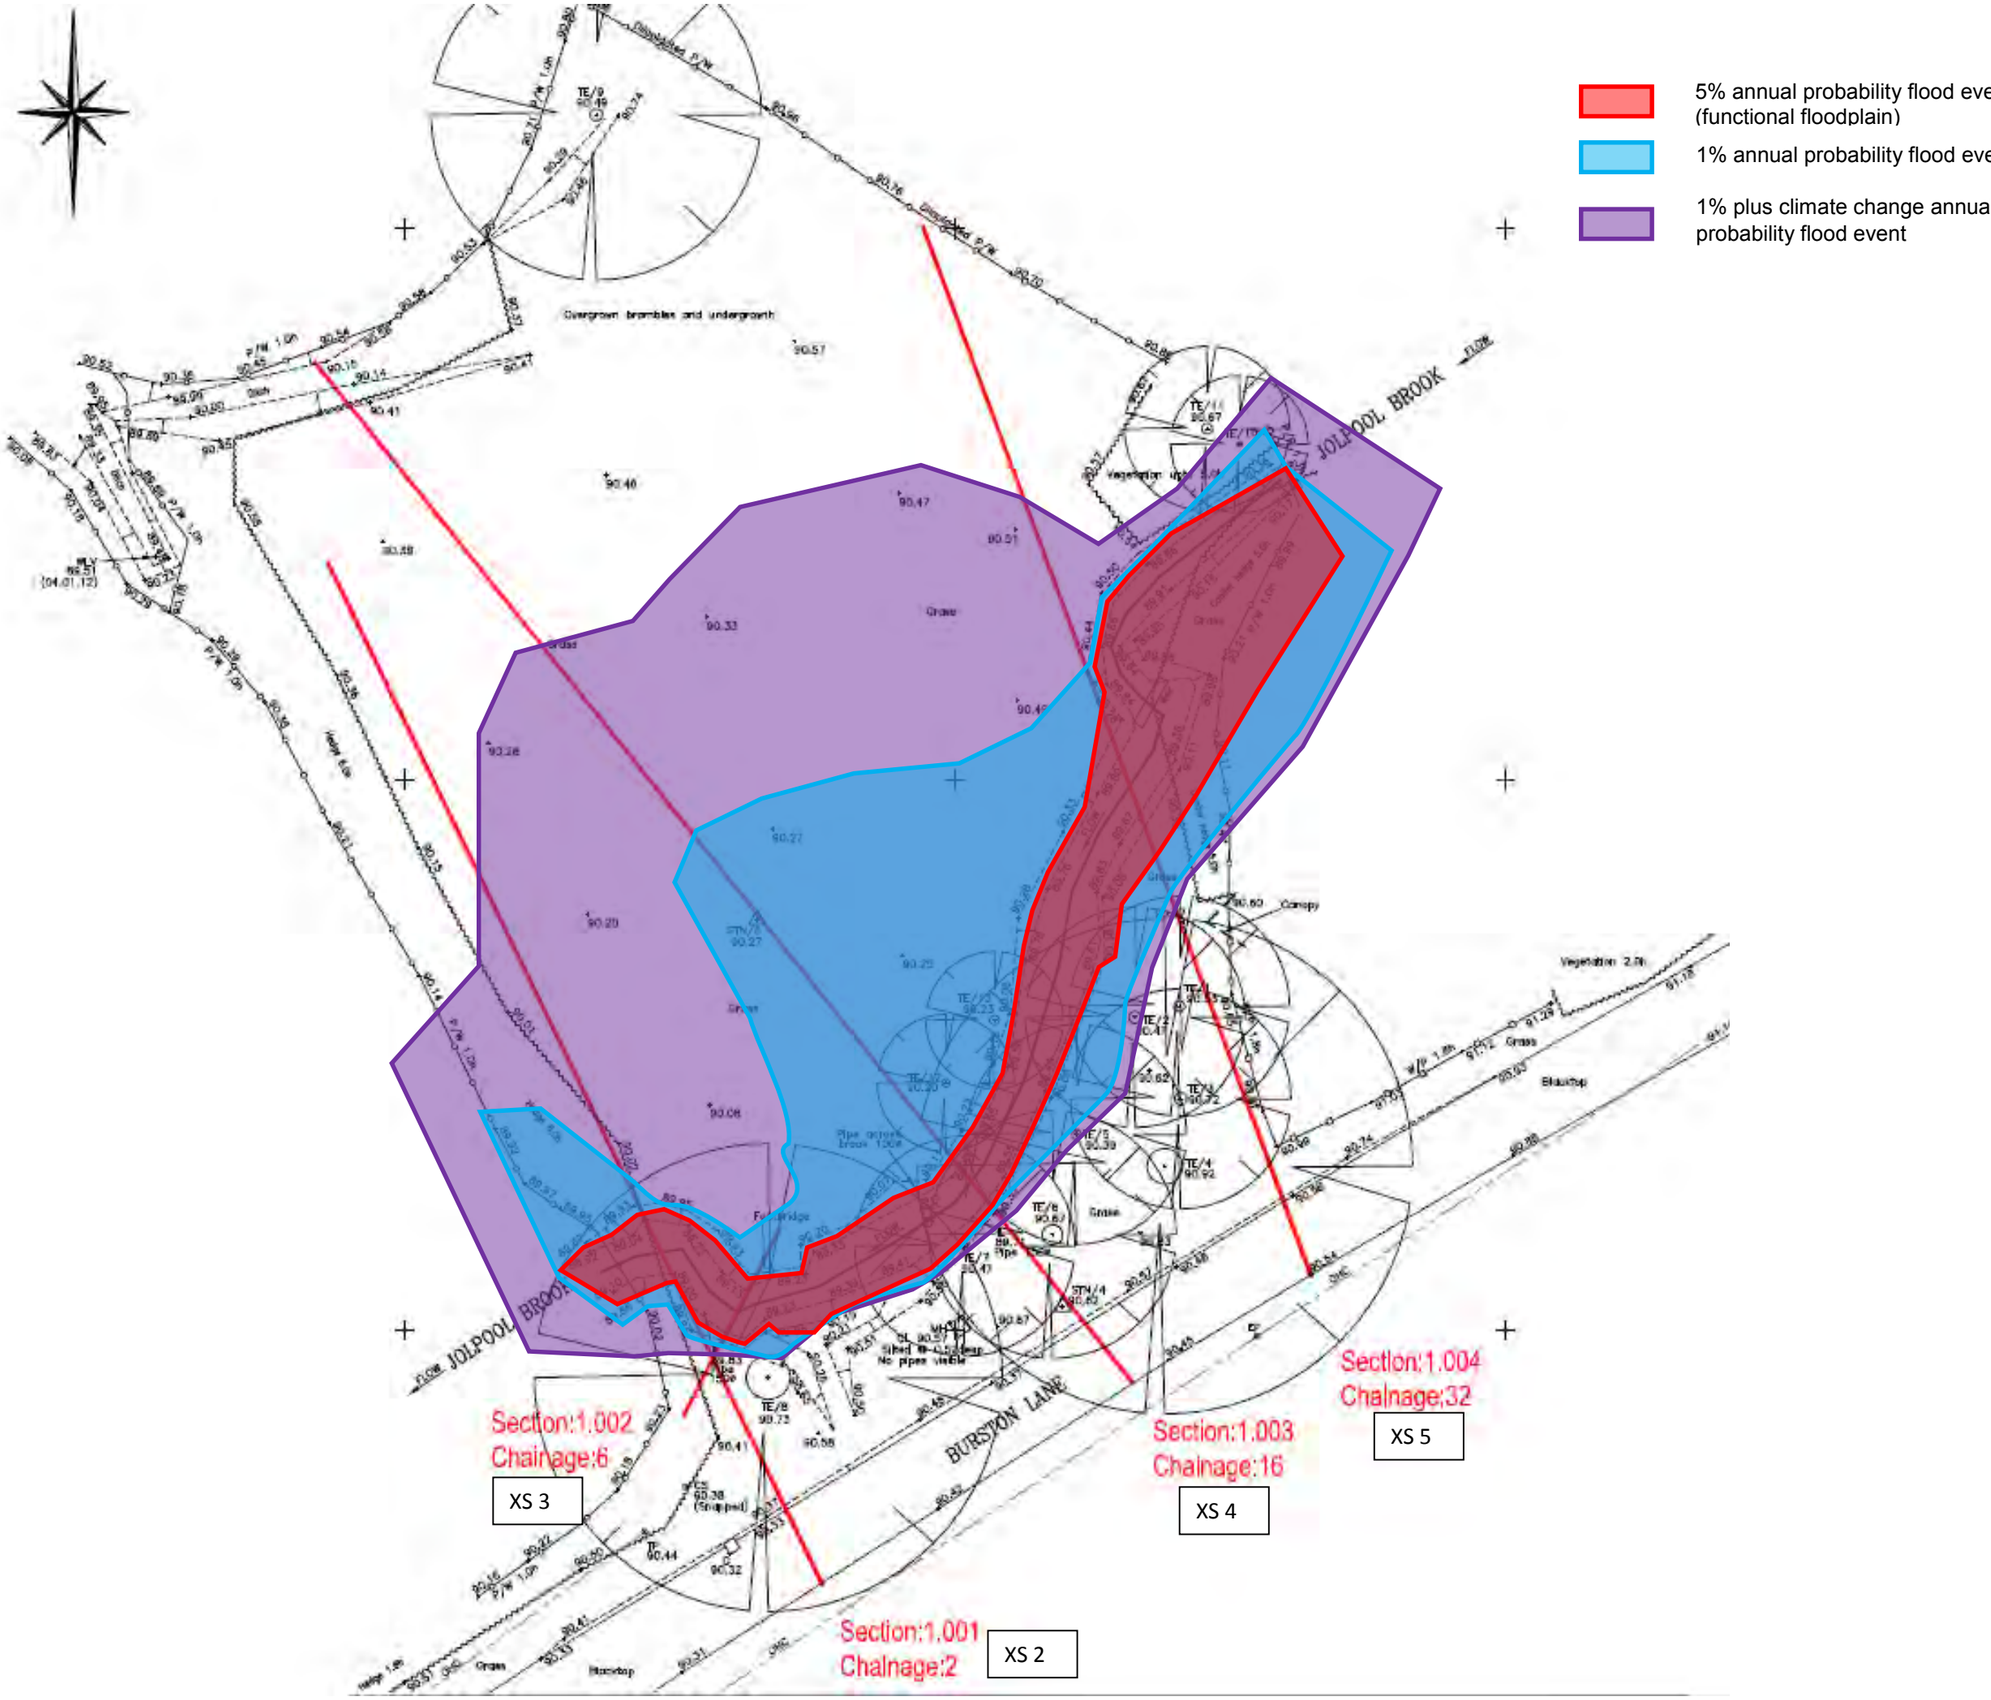
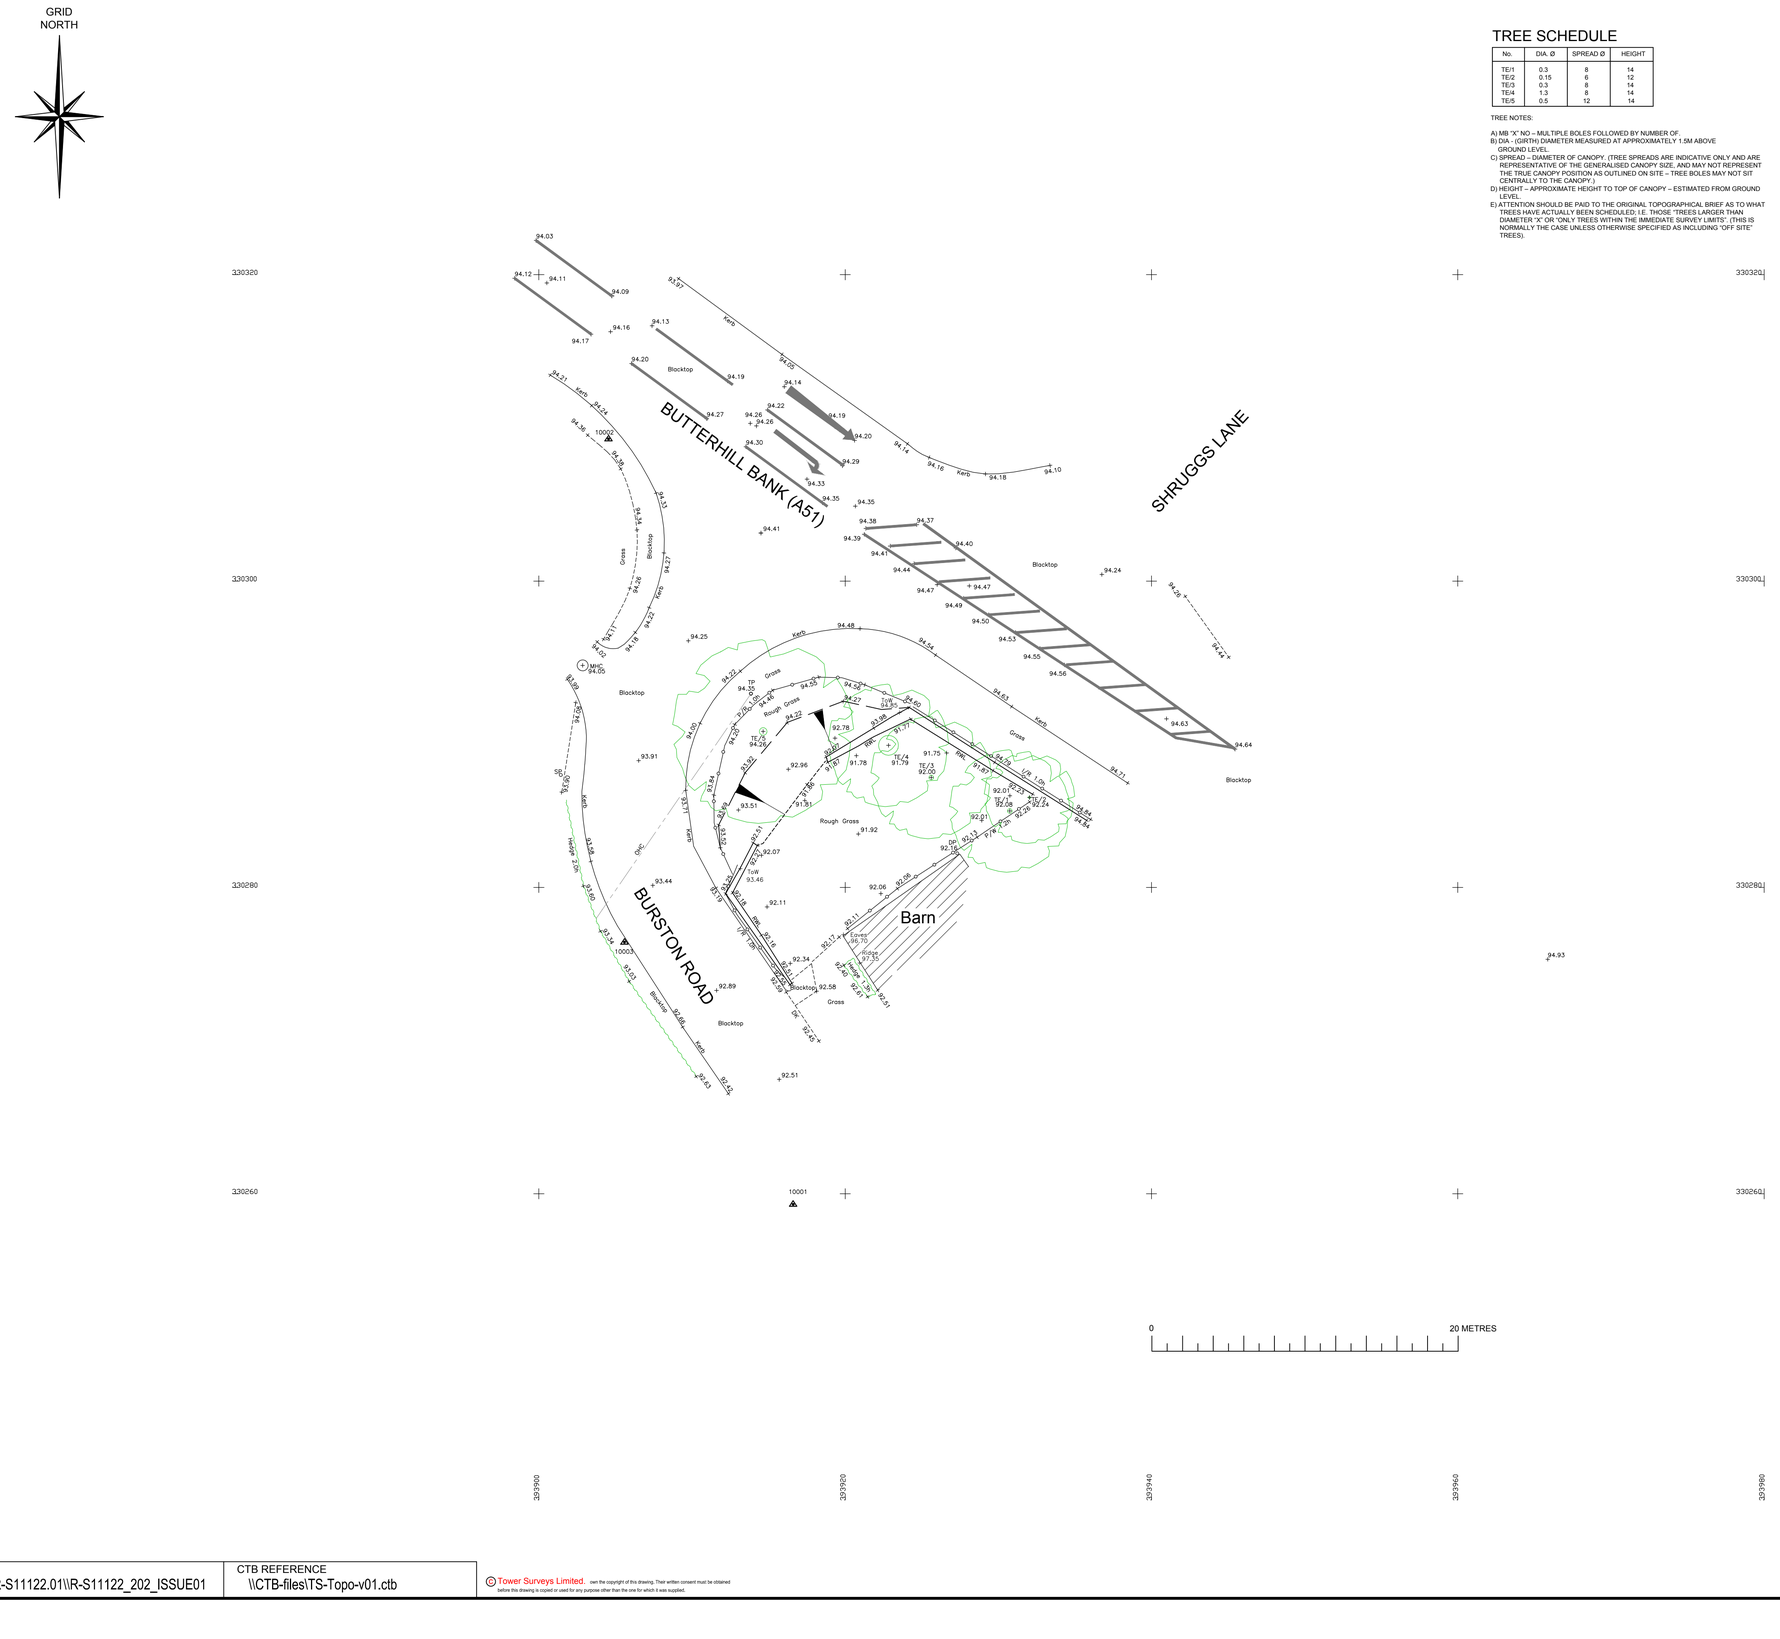
Appendix D – Flood extent at Site 2

This page intentionally left blank

Flood risk to Burston Lane site





TREE SCHEDULE

No.	DIA. Ø	SPREAD Ø	HEIGHT
TE/1	0.3	8	14
TE/2	0.15	6	12
TE/3	0.3	8	14
TE/4	1.3	8	14
TE/5	0.5	12	14

TREE NOTES:

A) MB "X" NO – MULTIPLE BOLES FOLLOWED BY NUMBER OF.
B) DIA - (GIRTH) DIAMETER MEASURED AT APPROXIMATELY 1.5M ABOVE GROUND LEVEL.
C) SPREAD – DIAMETER OF CANOPY. (TREE SPREADS ARE INDICATIVE ONLY AND ARE REPRESENTATIVE OF THE GENERALISED CANOPY SIZE, AND MAY NOT REPRESENT THE TRUE CANOPY POSITION AS OUTLINED ON SITE – TREE BOLES MAY NOT SIT CENTRALLY TO THE CANOPY.)
D) HEIGHT – APPROXIMATE HEIGHT TO TOP OF CANOPY – ESTIMATED FROM GROUND LEVEL.
E) ATTENTION SHOULD BE PAID TO THE ORIGINAL TOPOGRAPHICAL BRIEF AS TO WHAT TREES HAVE ACTUALLY BEEN SCHEDULED I.E. THOSE TREES LARGER THAN DIAMETER "X" OR "ONLY TREES WITHIN THE IMMEDIATE SURVEY LIMITS", (THIS IS NORMALLY THE CASE UNLESS OTHERWISE SPECIFIED AS INCLUDING "OFF SITE" TREES).

GENERAL

NO ALLOWANCE HAS BEEN MADE FOR SUB SURFACE ENTRY INTO MANHOLES OR OTHER CHAMBERS OR VOIDS BELOW GROUND LEVEL. THEREFORE ANY DETAILS RELATING TO DEPTHS, SIZES ETC. ARE TAKEN FROM ABOVE GROUND AND AS SUCH WILL BE APPROXIMATE ONLY.

THE CONTRACTOR IS TO CHECK AND VERIFY ALL CRITICAL DIMENSIONS AND LEVELS BEFORE WORK STARTS.

BURIED SERVICES SHOWN ON THIS DRAWING MAY BE ASSUMED ROUTES AND WILL NORMALLY BE OF UNKNOWN CONDITION, CONTRACTORS SHOULD UNDERTAKE SUITABLE VALIDATION WORK AND TAKE PARTICULAR CARE DURING EXCAVATION WORK; SAFE DIGGING PRACTICES SHOULD BE FOLLOWED.

SHOULD THERE BE ANY CONFLICT BETWEEN THE DETAILS INDICATED ON THIS DRAWING AND THOSE INDICATED ON OTHER DRAWINGS, THEN TOWER SURVEYS SHOULD BE INFORMED PRIOR TO CONSTRUCTION ON SITE.

IT IS IMPORTANT TO NOTE THAT THE SAME ACCURACIES IMPLIED BY THE PLOTTING SCALE ARE EQUALLY APPLICABLE TO DIGITAL DATA SUPPLIED FOR CAD.

EVERY EFFORT IS MADE TO IDENTIFY ALL VISIBLE ABOVE GROUND FEATURES. HOWEVER, IT SHOULD BE BORNE IN MIND THAT THERE MAY BE ITEMS OBSCURED AT THE TIME OF SURVEY.

VISIBLE FEATURES IN THE VICINITY OF THE BOUNDARIES, AS SHOWN ON THIS SURVEY, MAY NOT REPRESENT THE EXTENT OF LEGALLY CONVEYED OWNERSHIP.

To: Kev Ryder
Subject: FW: Sandon & Burston NP: Sites Affected by Flooding

Hi Kevin,

Having reviewed the information submitted the EA wishes to make the following comments:

Land adjacent to Burston Hall:
The Agency's flood maps indicate that the proposed development site referred to as 'Land adjacent to Burston Hall' is located within Flood Zones 2 and 3. Additional information has been provided in the form of a Flood Risk Assessment (FRA) for Burston Hall dated May 2009 which included results of hydraulic modelling of the Jolpool Brook. This provided some flood level information for the ordinary watercourse which runs through Burston.

The new information includes details of the location of cross sections related to the hydraulic model and topographic survey of the proposed development site. The FRA states the modelled levels indicate that flows on the Jolpool Brook remain in bank for the 1 in 100 year plus climate change event. It is suggested that the bridge may restrict flows and cause some overtopping but that these flows would be routed towards the River Trent or along the road but would not impact on the site. The topographic survey for the site indicates that levels are also higher than modelled flood levels on the River Trent.

The information provided therefore indicates that the Agency's published floodplain overestimates the extent of flooding in this location.

Based on the additional information provided we accept that flood risk on the site is likely to be lower than our current mapping indicates. Therefore the principle of development of two dwellings at this location is likely to be deliverable and policy compliant. However, prior to development further work will be required in order to provide a detailed flood outline for the Jolpool Brook to establish the impact this has on the site. We have not as yet reviewed the hydraulic model and this may need revisiting as part of any new application for development in this location. This additional information should form part of a site specific FRA to be submitted as part of a planning application, and will inform any mitigation measures that may be required to ensure the site is developed safely. A formal sequential test would also need to be undertaken to demonstrate that there are no other sites available.

Land at Burston Lane:
The Agency's flood maps indicate that the proposed development site referred to as 'Land at Burston Lane' is located within Flood Zone 3. Additional information in the form of a topographical survey and watercourse cross sections were provided as supporting evidence in January 2015. However, the floodplain information at this location is based on generalised JFlow mapping and we do not hold specific flood level data to inform development of this site. We note that the hydraulic modelling undertaken to date does not extend as far as the site in question. For us to be able to further comment on flood risk on this site we would need to see the Hydraulic Model extending to north of A51 to provide site specific flood levels.

Land at the Green Bungalow:
The Agency's flood maps indicate that the proposed development site referred to as '*Land at the Green Bungalow*' is located within Flood Zone 3. Additional information in the form of a topographical survey has been provided as supporting evidence. However, the floodplain information at this location is based on generalised JFlow mapping and we do not hold specific flood level data to inform development of this site. We note that the hydraulic modelling undertaken to date does not extend as far as the site in question. For us to be able to further comment on flood risk on this site we would need to see the Hydraulic Model extending to north of A51 to provide site specific flood levels.

In Summary:

We therefore recommend that the sites *'Land at Burston Lane'* and *'Land at the Green Bungalow'* are withdrawn from the plan and alternatives outside the floodplain are considered in preference. If no alternative sites outside the floodplain are available, the allocation of these sites would need to be supported by a Strategic Flood Risk Assessment (SFRA) ***PRIOR*** to the Neighbourhood Plan's adoption. This is required prior to the sites allocation to demonstrate that it is possible to bring the sites forward without being in conflict with national and local planning policy. The SFRA must demonstrate that the developments will be safe for their lifetime taking account of the vulnerability of its users, without increasing flood risk elsewhere, and, where possible reducing flood risk overall. A formal sequential test would need to be undertaken to demonstrate there are no other sites available. A detailed flood risk assessment may also be required in support of the planning application.

Following the submission of further information we consider that the site *'Land adjacent to Burston Hall'* could remain in the plan. However, a flood risk assessment will be required at detailed application stage and this should be reflected within a Neighbourhood Plan policy. The information submitted to the EA relating to the assessment of flood risk on this site will need to be submitted to the LPA in order for it to be formally included within the evidence base supporting the plan.

I hope this helps.

Should you have any further queries please get in touch.

Thanks.

John Dingley

8.1 – Environment Agency correspondence 23rd July 2015

Subject: RE: Burston and Sandon Neighbourhood Plan Sites - Hydraulic Assessment
Attachments: image001.jpg

Hi Kev,

We have reviewed the modelling submitted in support of the Burston & Sandon Neighbourhood Plan and wish to make the following comments.

This model covers 2 sites proposed for development within the NP area. Both are currently shown on the Environment Agency's flood maps as being located in Flood Zone 3, an area of land with a high probability of flooding. The modelling the Agency holds is high level jflow and as such does not provide detailed flood level information for these sites. In view of this, RAB consultants have produced a Hec Ras hydraulic model to provide further detail on the extant of flooding at these locations.

Results of the modelling indicates that due to the height of the A51, Site 1 is unlikely to be affected by flooding during any event used within this assessment. However, some flooding may occur if the culvert under the A51 were to become blocked. The modelling also confirms that Site 2 will flood during the 1 in 100 and 1 in 100 year (plus climate change) annual probability events.

It should be noted that the hydraulic modelling does not include the 1 in 1000 year event. As such the extent of Flood Zone 2 is unknown. Residential development is acceptable within Flood Zone 2 so long as appropriate mitigation is provided – floor levels should be set at least 600mm above the predicted 1 in 100 year flood level. A means of safe dry access to/from the site should also be identified. We therefore accept the principle of development in these two locations providing it is outside of Flood Zone 3. You will need to speak to the LPA to discuss any requirements regarding the sequential test and evidence base. It may be worthwhile re-drawing the site boundary to exclude any land within Flood Zone 3.

Our National Modelling Team have approved the Hec Ras Model deeming it fit for purpose. However, should the sites come forward for development in the future this modelling will need refining. This includes using the FEH Statistical method to assess the hydrology and provision of rationale for the final choice of method used. If the model is developed further it would be useful to undertake unsteady runs to capture attenuation upstream of the culvert and some sensitivity testing of the downstream boundary should be carried out with rationale of how it has been derived.

Hope this helps.

Regards,

John Dingley

Subject: RE: Burston and Sandon Neighbourhood Plan Sites - Hydraulic Assessment
Attachments: image001.jpg

Hi Kev,

Just managed to speak to Lucy about this. We'd have no objections in principle to the proposed access road across the watercourse / within Flood Zone 3.

As I have already suggested, it may be prudent for you to speak to the LLFA about this (Staffordshire County Council) as they will ultimately approve/consent any such works and will be able to advise on a suitable design standard. They can be contacted at flood.team@staffordshire.gov.uk.

Your site boundary will have to be re-drawn to incorporate the proposed access road (if it doesn't already). You will also need to consider this in your work on the sequential test.

All other issues such as modelling for blockages etc can be addressed at the detailed application stage. If the proposed road were to flood (i.e. it couldn't be raised above the 1 in 100 year flood level) you may have to consider emergency access/egress arrangements.

Hope this helps.

John
